# System Initialization

---

In this chapter, we describe how to initialize the system settings on the V2403 embedded computer when booting up for the first time.

The following topic is covered in this chapter:

- **Overview**
- **Initializing User Settings**

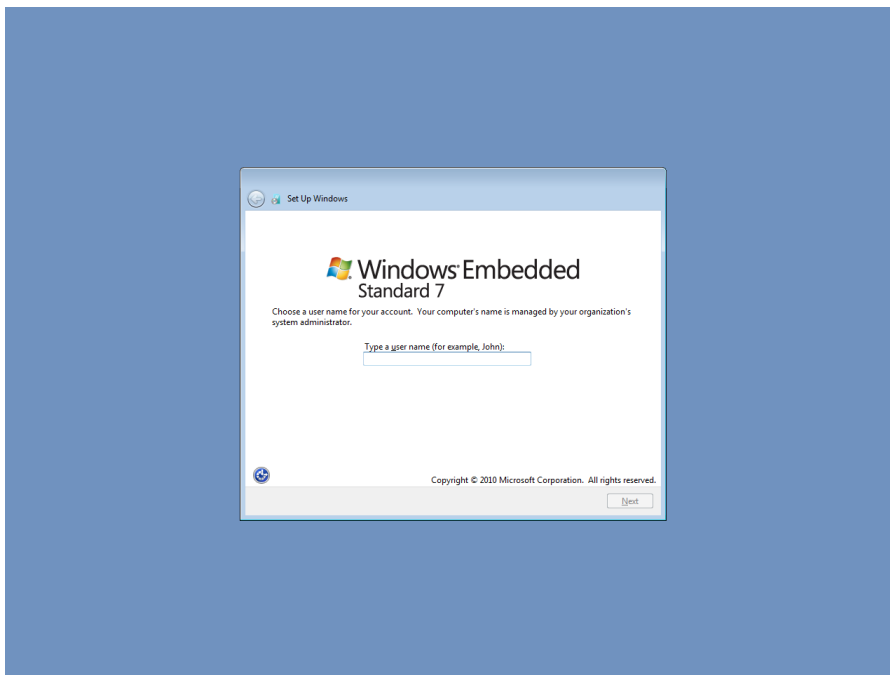

## Overview

Similar to using a laptop computer for the first time, you need to specify a user name and create a user account to start using the V2403 embedded computer. Follow the procedure described in the next section.

**NOTE** If you perform a system recovery on the V2403 embedded computer, the system automatically resets to the factory defaults. You must initialize the user settings again.

## Initializing User Settings

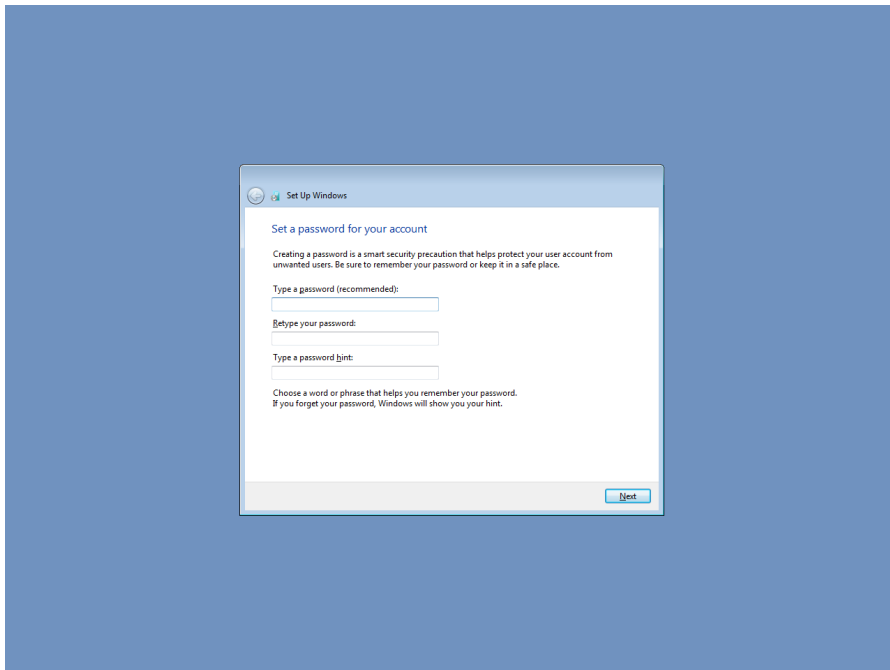

1. When you turn on the embedded computer for the first time, enter a user name for the computer.

2. Type a password and retype the password to confirm.

You may also type a password hint that you can refer to if you forget your password. If you do not want to set a password, leave all three fields blank. Click **Next** to continue.

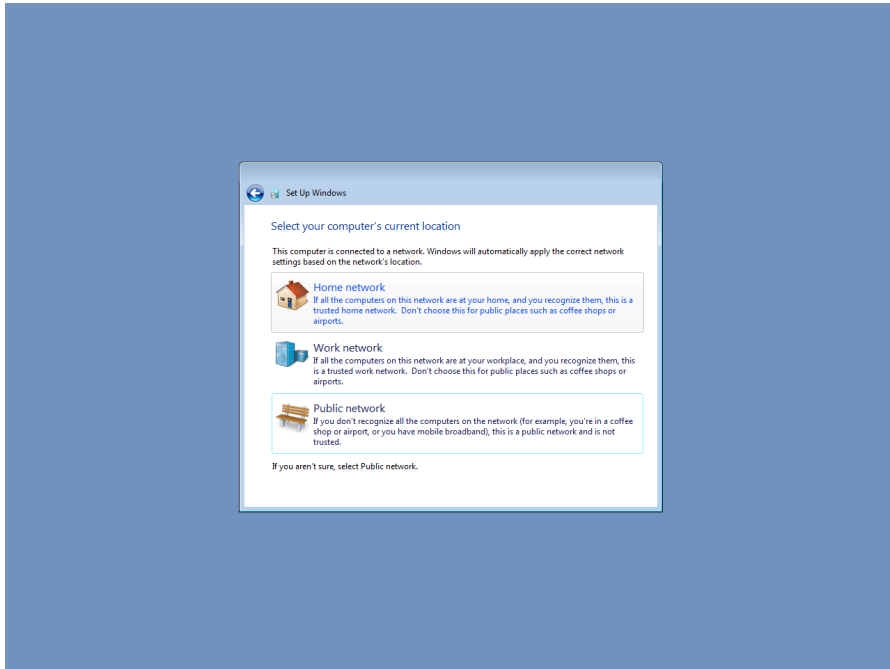

3. Select a Windows update option.

- 4. Select the computer's current location, and review the time and date settings.

Windows automatically applies the appropriate network settings based on the type of network you select.

- 5. When the Windows desktop screen appears, you can start using your V2403 embedded computer.

## Configuring the Serial Interface

---

This chapter describes how to configure the serial interface on the V2403 embedded computer.

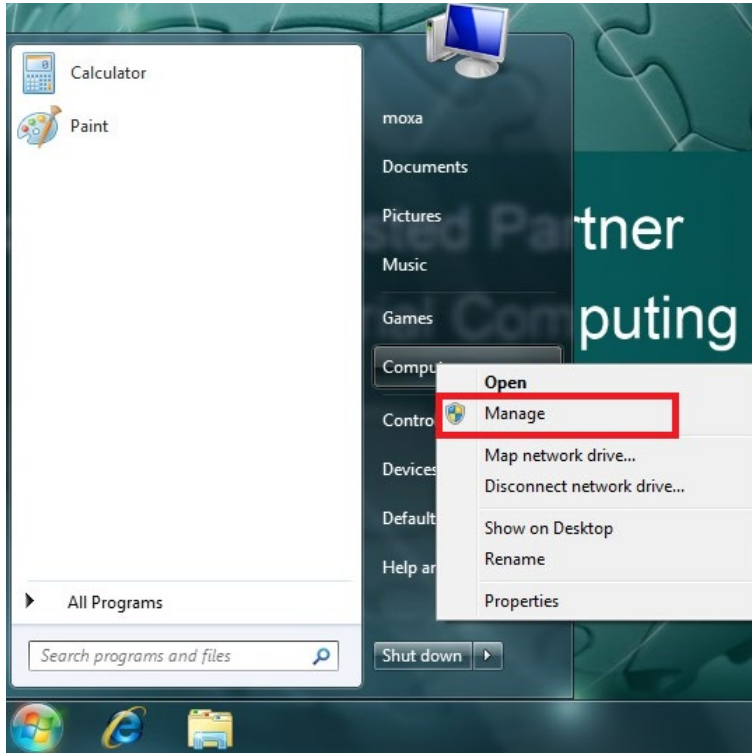

The following topics are covered in this chapter:

- ❑ **Configuring the Serial Interface Mode**
- ❑ **Changing a Beginning COM Number**

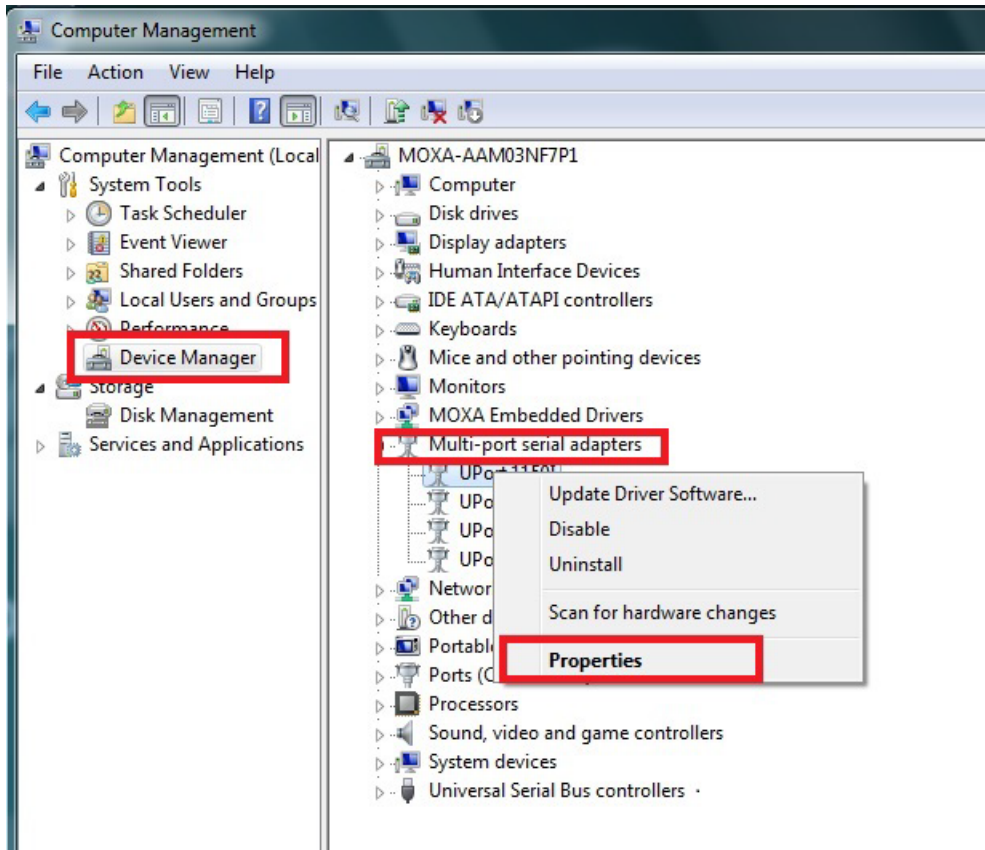

# Configuring the Serial Interface Mode

Complete the following steps to configure the serial interface mode:

5. Click **View Settings** again to check that the beginning COM number was changed, and then click **OK** to exit.

# Enabling Embedded Filters

---

In this chapter, we describe how to enable the V2403's embedded filters.

The following topics are covered in this chapter:

## ❑ **Enhanced Write Filter**

- Overview
- Enabling Enhanced Write Filter
- Committing Data and/or Disabling EWF

## ❑ **File-Based Write Filter**

- Configuring File-Based Write Filter
- Excluding Files from FBWF Protection
- Managing Temporary Files Cached in the Overlay

# Enhanced Write Filter

## Overview

Enhanced Write Filter (EWF) enables you to protect a volume from unauthorized writes by making the main operating system (OS) drive a write-protected volume, effectively making the system a read-only system for most users. This provides much stronger protection against malicious computer attacks (such as trojans, worms, and viruses).

Enhanced Write Filter (EWF) allows Windows 7 users to protect data on their storage drive from permanent changes of any sort, at the lowest level of hardware protection available: the bit level. **EWF** allows the OS to boot from the hard disk, but protects the system by creating a virtual file system called an **overlay**. All writes to a EWF-protected volume (the **hard disk** in the following figure) are only recorded on this virtual overlay (the **EWF Volume** in the following figure), which is stored independently in random access memory (RAM).

Because EWF does not write data directly to the hard disk but instead only records system writes to this virtual RAM overlay, any data that is “written” during system operation will disappear upon the next re-boot. This approach allows the system to operate as if it is writeable when in reality all OS and user-space file systems are stored in a permanent, read-only state.

If required, data written to the overlay can be committed to the protected volume, but this requires additional setup and permissions that can only be granted by the administrator.

The following figure shows an overview of the EWF structure.

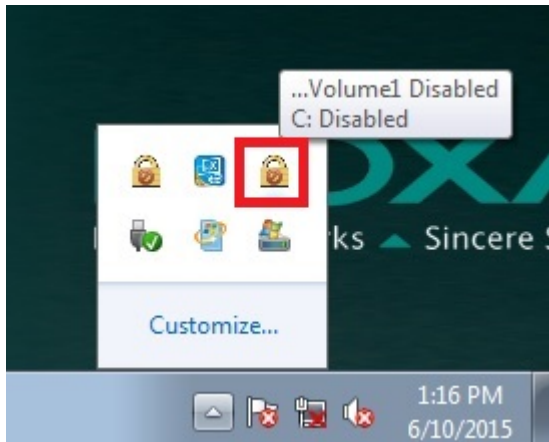

For more detailed information about EWF configuration and usage, refer to the following resources:

- Visit Microsoft's [EWF Volume Configuration](#) help pages.
- See Microsoft's [EWF overview](#) on the official Microsoft EWF help pages.
- See Microsoft's detailed description of [EWF modes](#) on the EWF help pages.
- See Microsoft's detailed description of the [EWF API](#).
- For EWF commands, refer to the MSDN web site:  
<http://msdn.microsoft.com/en-us/library/ms940853%28v=winembedded.5%29.aspx>

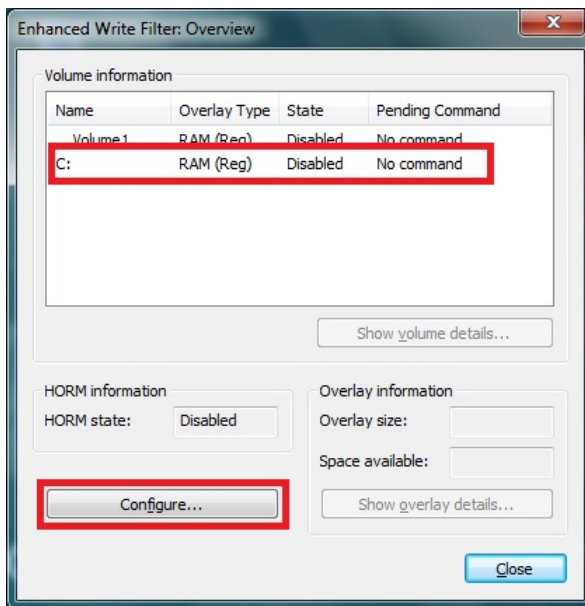

## Enabling Enhanced Write Filter

Follow these steps to enable Enhanced Write Filter:

1. To open EWF, double-click the padlock icon in the system tray.  
You may need to show hidden icons in the system tray.

2. In the **Volume Information** area, select the partition you want to enable write-protection on and click **Configure...**

- The Configuration dialog box appears. Select **Enable** from the **Pending command** drop-down list and click **OK**.

- Reboot the system.
- Log into the system and verify that the padlock icon in the system tray indicates that the drive volume is locked with EWF.

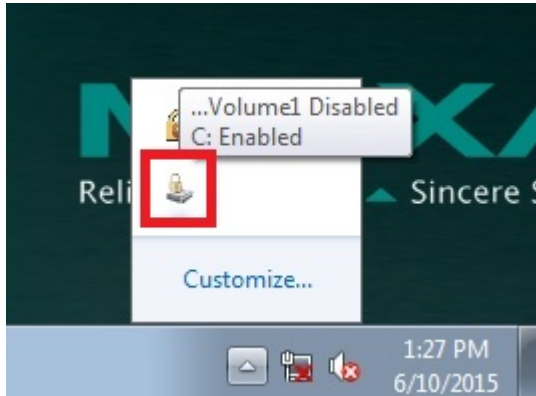

## Committing Data and/or Disabling EWF

Perform the following steps to write (or commit) data to a EWF-enabled drive.

**NOTE** You must have administrator privileges to commit data to the drive.

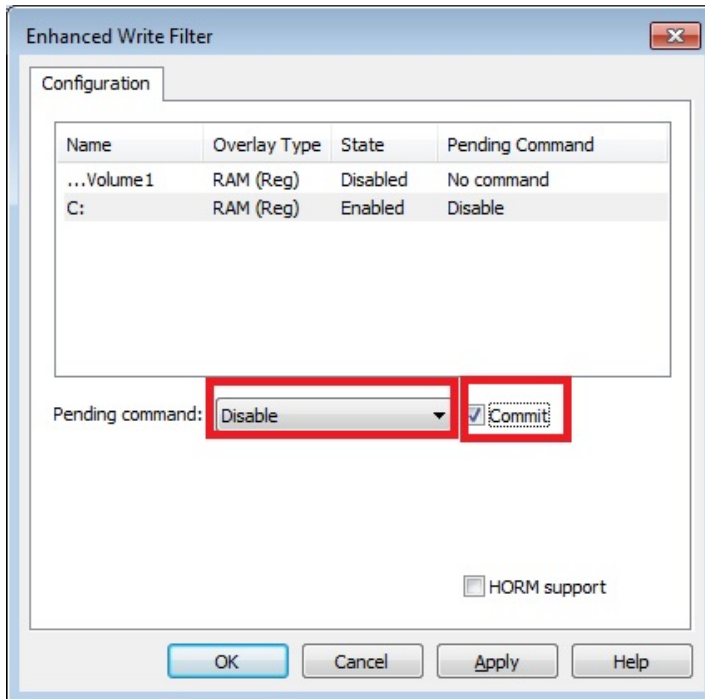

1. Double-click the padlocked drive in the system tray.  
You may need to show hidden icons in the system tray.

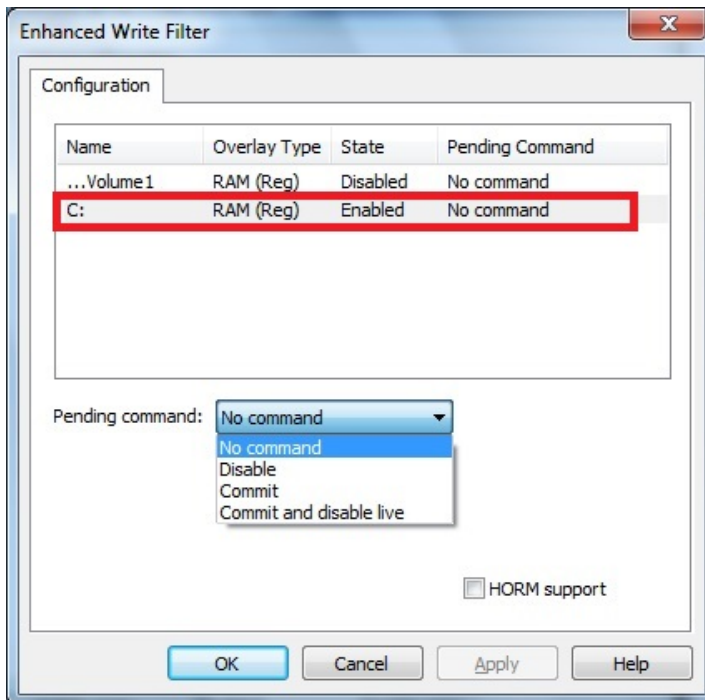

2. In the **Enhanced Write Filter: Overview** dialog box, select the drive you want to configure and click **Configure**.

3. In the Enhanced Write Filter Configuration screen, select a drive volume; then, select an option from the **Pending Command** drop-down list:
  - **No Command**
  - **Disable:** Disables EWF on the selected drive. Select the “commit” checkbox and reboot the system for the changes to take effect.
  - **Commit:** Writes all current system changes to the hard drive.

- **Commit and Disable Live:** Writes all current data and changes to the system, and also turns off EWF on the selected drive (so that all future data and system changes will also be committed to the drive). The system does not automatically reboot if you select this option.

**NOTE** For detailed information, go to the Microsoft website at [http://msdn.microsoft.com/en-us/library/ff794092\(v=winembedded.60\).aspx](http://msdn.microsoft.com/en-us/library/ff794092(v=winembedded.60).aspx).

## File-Based Write Filter

This section describes how to use the File-Based Writer Filter (FBWF). Note that when Enhanced Writer Filter is enabled, the File-Based Writer Filter function will not work.

According to Microsoft:

“File-Based Write Filter (FBWF) allows the Windows Embedded platform to maintain the appearance of read and write access on write-sensitive or read-only storage. FBWF makes read and write access transparent to applications.

Writing to storage media may be undesirable or impossible in embedded devices. FBWF redirects all writes targeted for protected volumes to a RAM cache called an overlay. Used in this context, an overlay is similar to a transparency overlay on an overhead projector. Any change made to the overlay affects the picture as seen in the aggregate, but if the overlay is removed, the underlying picture remains unchanged.”

FBWF supports an advanced ESF feature, which allows users to specify which directory to write data to. The default directory is c:\temp. The advanced feature allows you can read/write data to disk without committing an action.

## Configuring File-Based Write Filter

Complete the following steps to enable the File-Based Write Filter (FBWF) feature. Although you can enable FBWF and EWF on the same computer, FBWF does not protect a volume that is already protected by EWF. Similarly, EWF does not protect a volume that is already protected by FBWF.

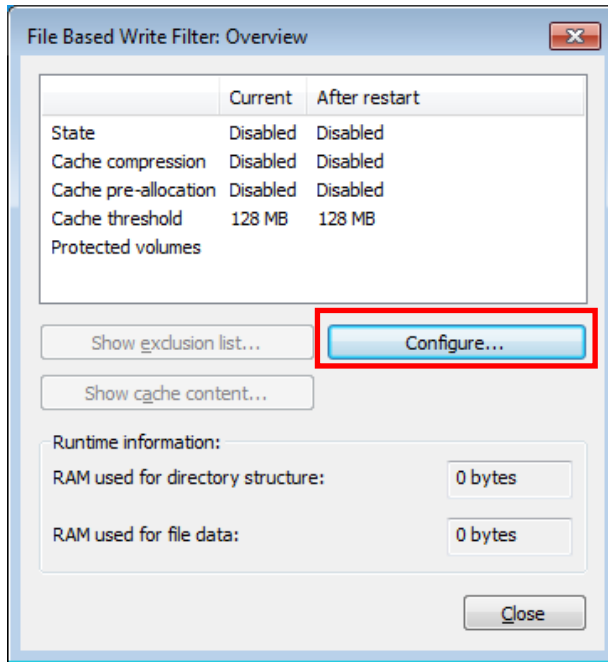

**NOTE** Before using FBWF, make sure that you disable EWF.

1. Double-click the padlock icon in the system tray.  
You may need to show hidden icons in the system tray.

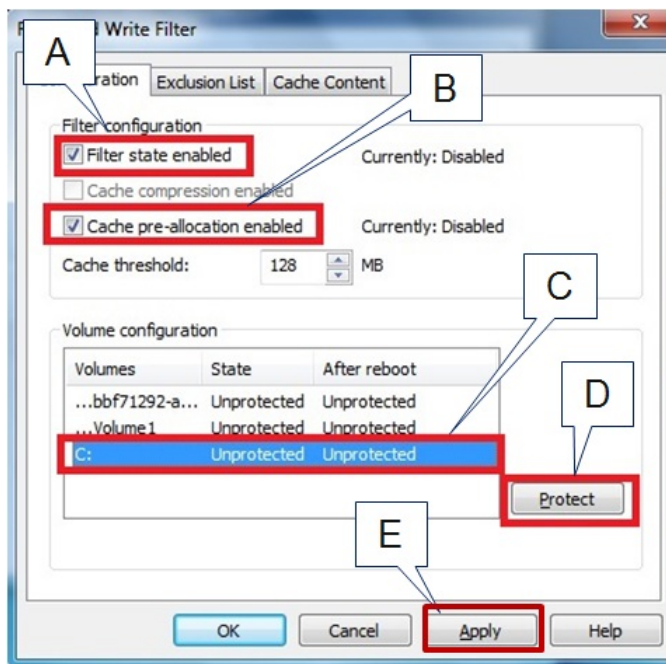

**NOTE** When disabled, the EWF and FBWF icons in the system tray look the same. To verify that you have opened the correct writer filter program, check the screen title.

2. In the **File Based Writer Filter: Overview** screen, click **Configure**.

3. To enable FBWF protection on a storage drive, perform the following actions:
  - a. Select **Filter state enabled** and **Cache pre-allocation enabled**.
  - b. In the **Volume Configuration** area, select the storage drive you want to protect and click **Protect**.
  - c. Click **Apply** or **OK**.

**NOTE** To minimize memory usage on the overlay cache, select **Cache compression enabled**. However, cache compression decreases performance when accessing protected volumes. Select **Cache pre-allocation enable** to set the memory space available for the overlay cache when the system starts up, instead of adjusting it as needed. You cannot enable cache pre-allocation and cache compression at the same time. The **cache threshold** field sets the amount of memory that can be used by the write filter for the overlay cache. The default value and size limits for the overlay cache vary depending on the operating system.

4. Reboot the system.
5. Log into the system and verify that the padlock icon in the system tray displays a number and indicates that FBWF is enabled on a drive. The following figure shows an example.

## Excluding Files from FBWF Protection

1. Double-click the FBWF icon in the system tray.  
You may need to show hidden icons in the system tray.
2. In the **File Based Write Filter: Overview** window, click **Configure**.

- Click the **Exclusion List** tab and configure the following fields:
  - Volume name** – Select a drive volume from the drop-down list.
  - Add path** – click the ellipsis (...) button to select a directory or file you want to exclude from FBWF protection; then click the + button. The system displays the selected directory or file in the **Path** table.

- Click the **Cache Content** tab and click **Apply** and **OK**

- Reboot the system to make the changes take effect.

## Managing Temporary Files Cached in the Overlay

- On the **Cached Content** tab, you will see all the files currently cached in the RAM overlay. Three commands are available:
  - Commit**: Save a file from the cache to permanent storage, delete the file from the overlay, and overwrite the original file.
  - Restore**: Return the file to its original state, remove the file from the overlay cache and discard the changes that added the file to the cache.

- **Add to exclusion list:** Adds the file to the exclusion list after the next restart. This will delete the file from the cached overlay and replace the current file in permanent storage with the modified cache file.

The most common usage of the Cache Content filter will likely be to permanently write content to the hard drive. To do this, select the file you wish to write to permanent memory and click on the **commit** button. This will delete the file from the cached overlay and replace the current file in permanent storage with the modified cache file.

Keep in mind that committing a configuration or application file will permanently alter the setup and/or performance of the application or system.

For more details about FBWF configuration and usage, refer to the Microsoft help file that came with your computer, or go to the following websites:

- Microsoft's [FBWF Installation and Configuration](#) help pages.
- Microsoft's [FBWF overview](#) on the official Microsoft FBWF help pages.

# System Recovery

---

This chapter describes the system recovery process that you can perform if the system is not functioning properly.

The following topics are covered in this chapter:

- **Overview**
- **Setting Up the Recovery Environment**
- **Recovery Procedure**
- **Saving the System Image to a USB Device**

## Overview

This section describes how to prepare your computer for recovery in the event the system becomes unstable. You can perform a system recovery using one of the following system images:

- A clean factory default image.
- A user-generated image created from a fully configured, fully set up system.

Before you perform a system recovery, set up the system environment.

## Setting Up the Recovery Environment

To set up the recovery environment on a V2403 computer, you will need a USB drive that has at least 4 GB of memory, and a copy of the recovery programs and system image file. To set up the recovery environment, do the following:

1. Copy the recovery programs and system image file on to the USB drive and set up the drive as a live-drive system with an ISO image of the boot environment.
2. Reboot the system and configure the BIOS to boot the recovery system from the USB port.
3. An image of the current software system will be created on the USB drive. The recovery environment will use this image when restoring the system.
4. Reboot the system again and configure the BIOS to its original state.

## Recovery Procedure

### Step 1: Prepare your USB drive

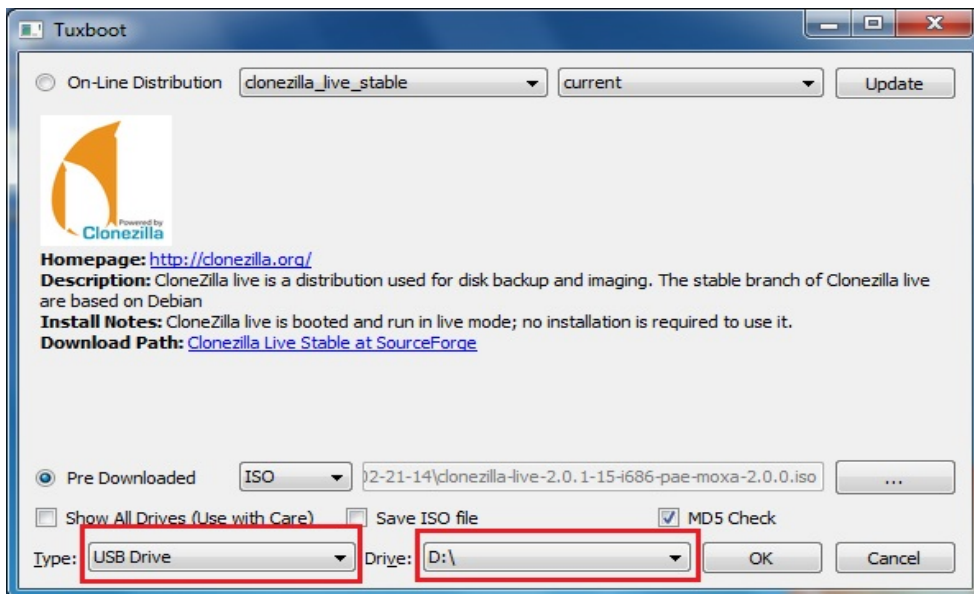

1. Execute **tuxboot-windows-23.exe** from the <Software DVD>\Recovery\ folder on the Software DVD, select **Pre Download**, and then click "..."

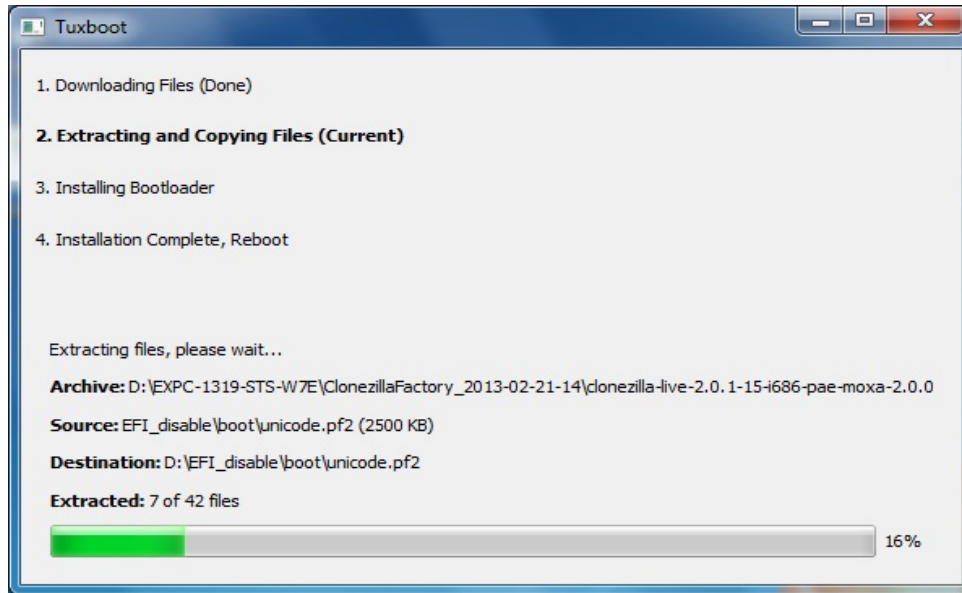

2. Select the ISO file in the directory <Software DVD>\Recovery\

3. Select **USB Drive** type, select a **Drive**, and then click **OK** to continue.

- The boot files will be copied to your USB drive.

- When finished, click **Exit** to stop the program.

- Manually copy the **os\_image** directory from the <Software DVD>\Recovery\ folder on the Software DVD to \home\partimag\ on the USB drive.

## Step 2: Change the BIOS Settings

You will need to change the BIOS settings to boot from the USB disk.

1. Turn on the computer and press **F2**. Select **SCU** in the following screen.

2. Select **Boot** and then select **Legacy**. Press **Enter** to continue.

3. Select **Boot Type Order**.

4. Select USB disk and then press "+" to move it to the first boot device position.

**Warning: An incorrect boot priority will lead to recovery failure.**

5. Press **F10** and then press **Enter** to save and exit the BIOS setup.

### Step 3: Restore the system from the USB drive

Connect the USB disk to any of the V2403's USB ports and then reboot the computer. The system will boot from the USB disk and the Pre-installation Environment and the recovery utility will appear.

1. Select **clonezilla live restore disk(auto Mode)** option if you want Clonezilla to help you recover the MBR and decompress the image automatically.

2. Wait for the USB drive boot process to finish.

7. Remove the USB drive after the computer has been powered off.

### Step 4: Change the BIOS Settings to Boot from the Original Disk

Now you will need to change the boot priority so that it can boot from the original disk. As the system reboots, press **F2** to enter the BIOS setup menu.

1. Select **Hard Disk Drive** and then press **+** to move to the first boot device position, and then press **Enter**. Make sure the hard disk has first boot priority.

2. Press **F10** and then press **Enter** to save and exit BIOS settings.

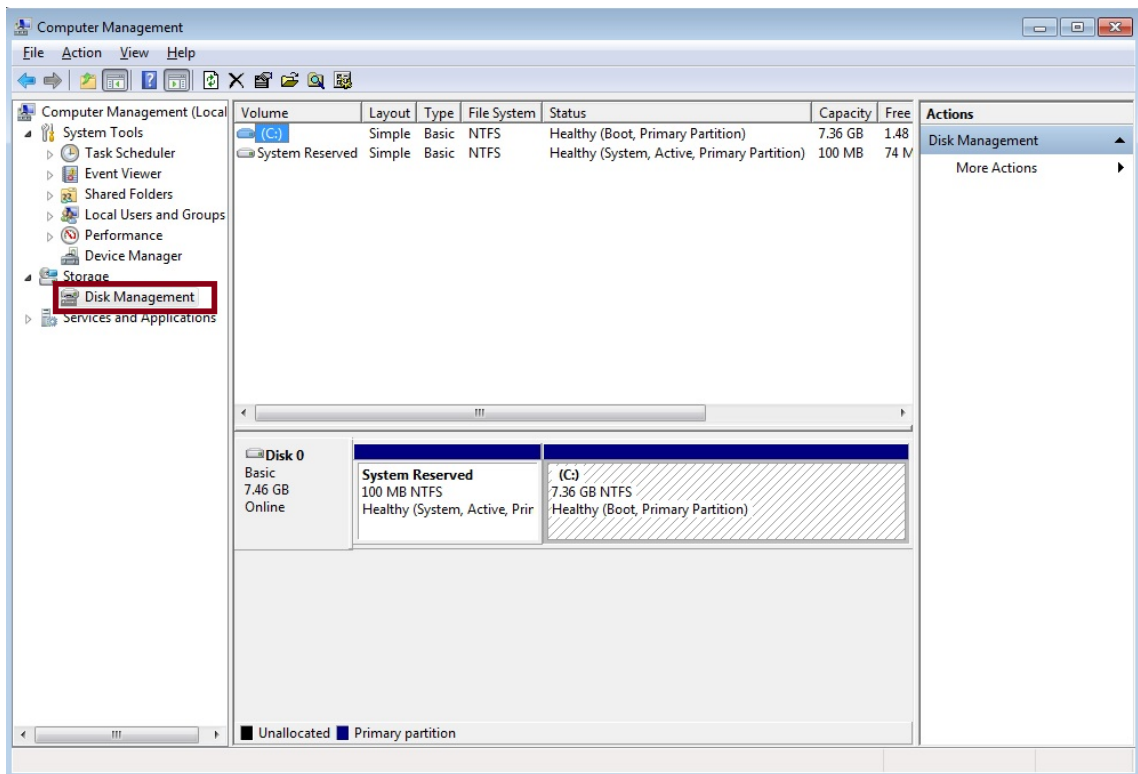

## Saving the System Image to a USB Device

You can also save the current system image to a USB device for system recovery in case the system crashes. Before saving the system image to the USB device, we suggest removing all files under `\home\partimag\` on the USB device. Compress the file system on your system before saving the system image to the USB device to ensure smooth completion of the task.

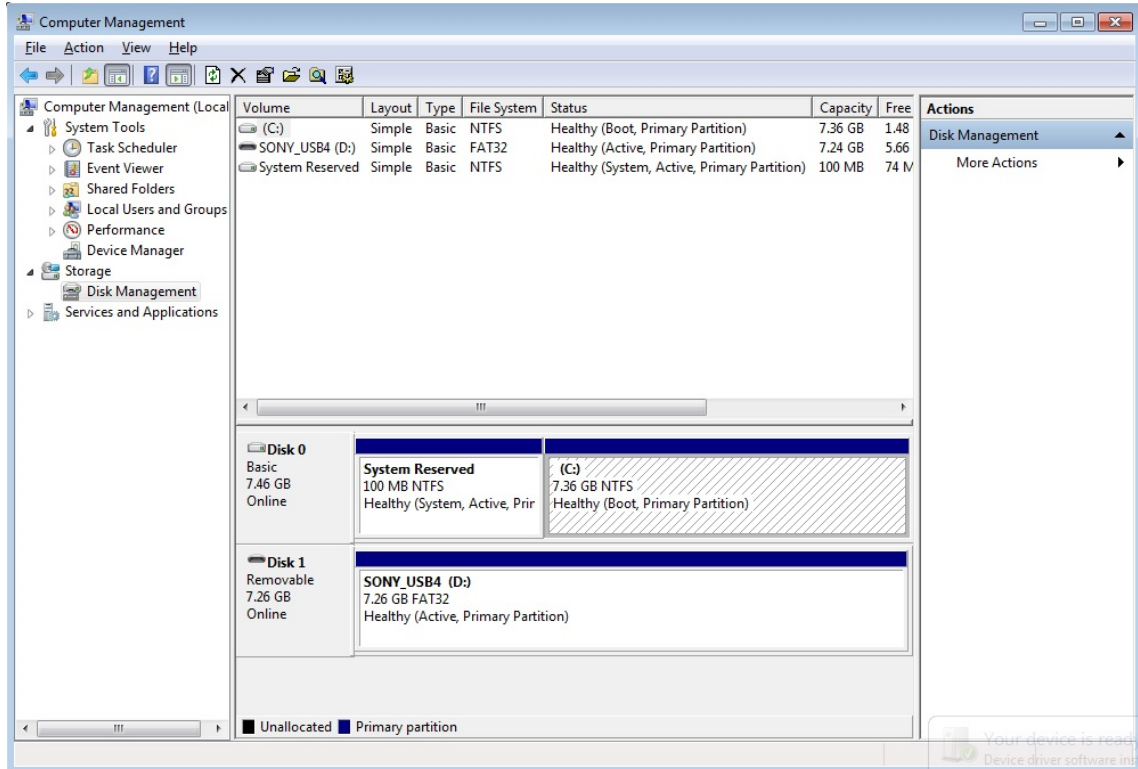

### Compressing the File System on Windows Embedded 7

1. In the **start menu**, right click on **Computer** and select **Manage**. Click on **Disk Management** in the left panel.

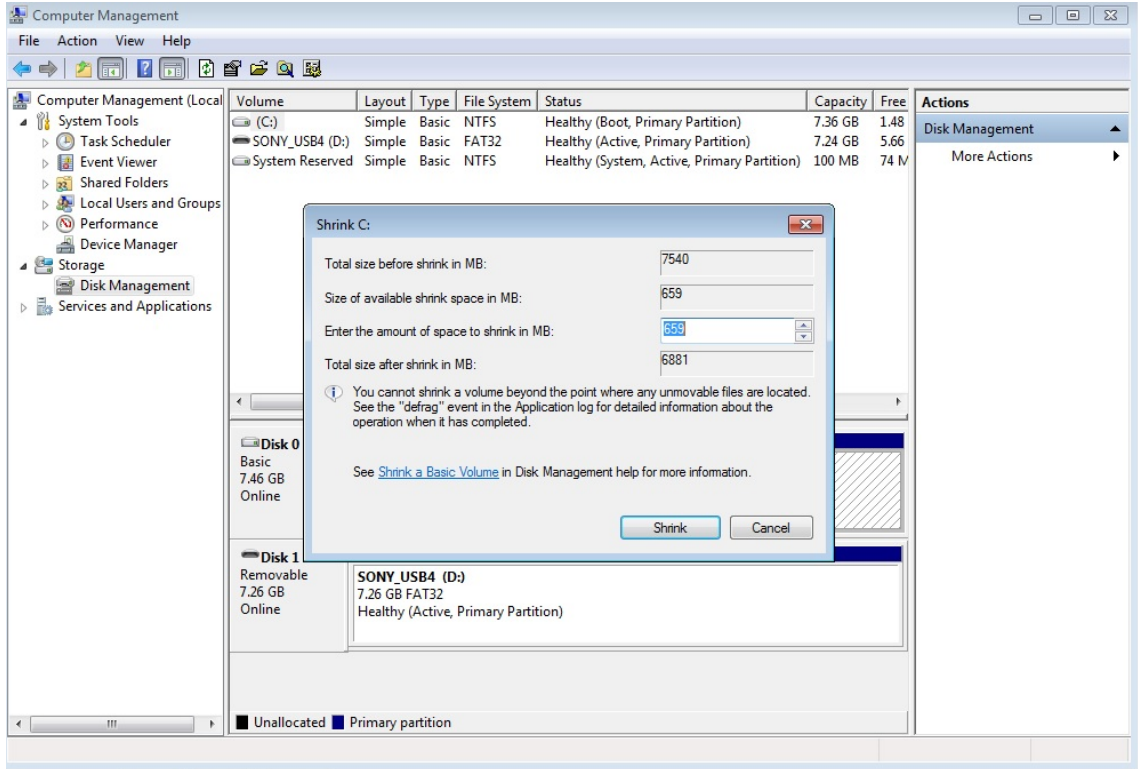

2. Insert the USB device that you want to save the system image to, in the USB port of the system. Click on **Disk Management** to view the size of the file system in **Disk 0** (sum of "System Reserved" and "C:").

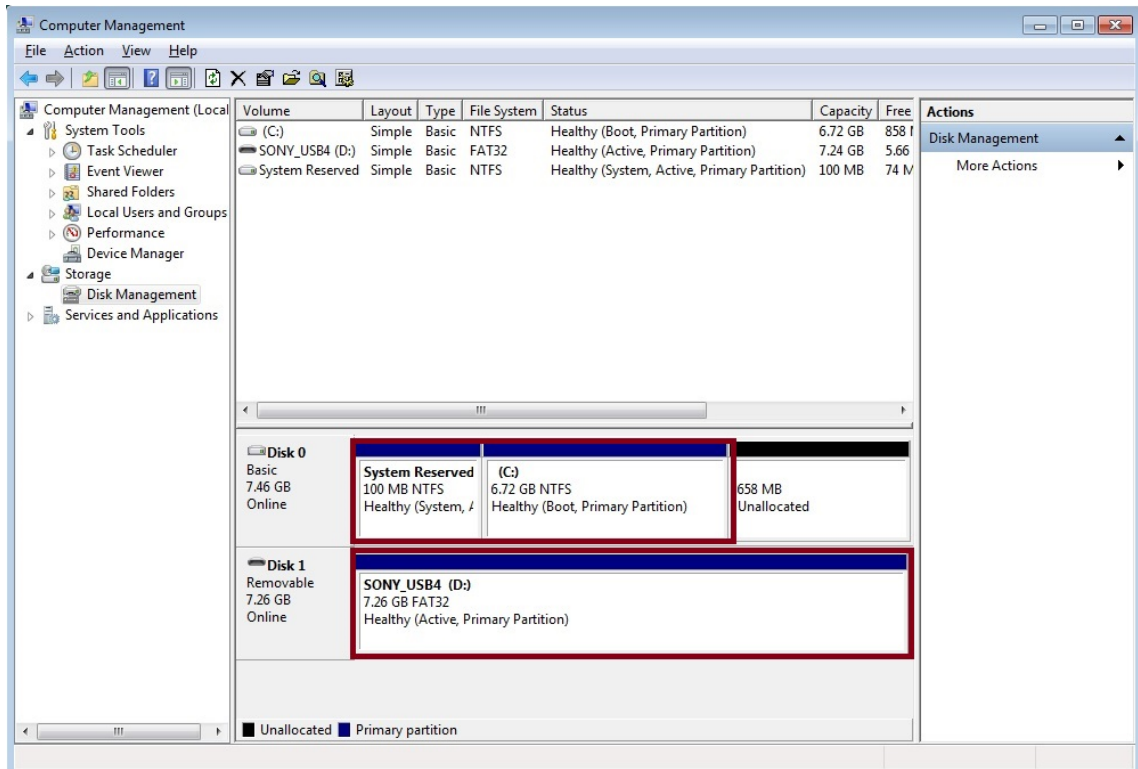

3. Right click on **(C:)** and select **Shrink Volume**.

- Specify a value in **Enter the amount of space to shrink in MB** and click **Shrink**.  
The **Total size after shrink in MB** must be smaller than the size of the USB disk.

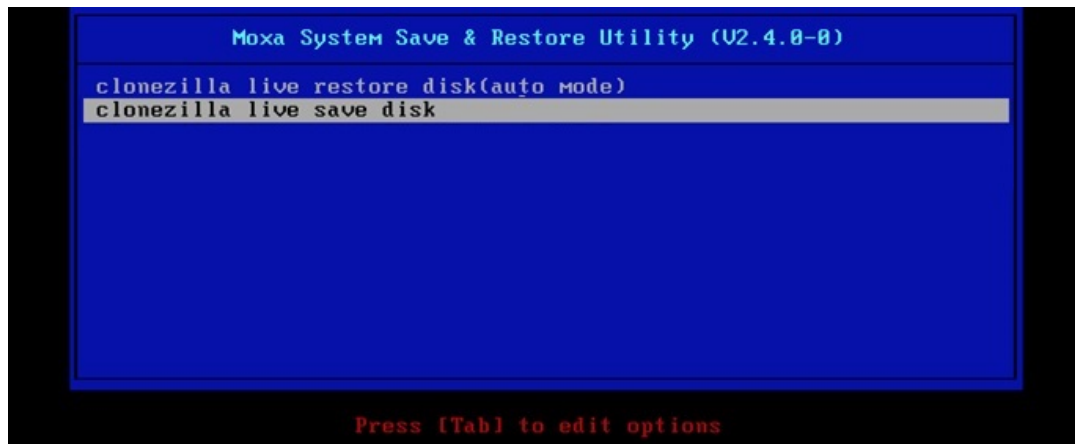

- Make sure that the **Total size after shrink in MB** is smaller than the size of USB disk.

Now reboot the system and change the boot order in the BIOS setting (refer to the "Boot Setting" section of the Hardware Manual) to set the USB device as the first boot priority. Do the following to complete saving the system image to the USB device:

1. Select **clonezilla live save disk**.

2. Wait for the USB drive boot process to finish.

## Proactive Monitoring

---

The V2403 series supports the "Moxa Proactive Monitoring" utility. See the "Moxa Proactive Monitoring Windows Software User's Manual" for details. The manual can be found on the product CD/DVD or downloaded from Moxa's website. Note that the V2403 does not support hardware relay.
