3 WIRING: INPUTS AND OUTPUTS

3.1 - Digital Input & Output Information

DIGITAL INPUTS

Digital inputs may be wired in either a Positive Logic or Negative Logic fashion as shown. The setting in the Cscape Hardware Configuration for the Digital Inputs must match the wiring used in order for the correct input states to be registered. When used as a normal input and not for high speed functions, the state of the input is reflected in registers %I1 - %I12.

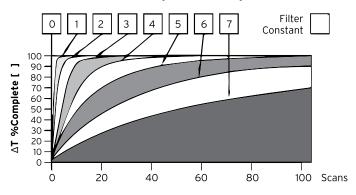

Digital inputs may alternately be specified for use with High Speed Counter functions, also found in the Hardware Configuration for Digital Inputs. Refer to the EXL10 User Manual [MAN1029] for full details.

wiring: I-O continued...

3.2 - Analog Input Information

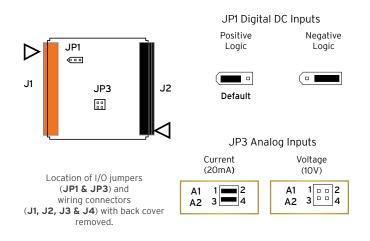

Raw input values for channels 1-4 are found in the registers as Integer-type data with a range from 0 - 32000.

Analog inputs may be filtered digitally with the Filter Constant found in the Cscape Hardware Configuration for Analog Inputs. Valid filter values are 0 - 7 and act according to the following chart.

Data Values		
INPUT MODE:	DATA FORMAT, 12-bit INT:	
0-20mA, 4-20mA	0-32000	
0-10V	0-32000	

3.3 - Jumper Setting Details

NOTE: The Cscape Module Configuration must match the selected I/O (JP) jumper settings. (Cscape Path: Controller -> Hardware Configuration -> Local I/O -> Config -> Module Setup -> Analog In)

NOTE: When using JP3 (A1-A2), each channel can be independently configured.

5 BUILT-IN I/O

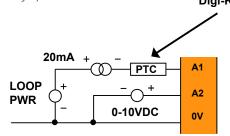

5.1 Built-in I/O for Model 3

All EXL10 models (except Model 0) feature built-in I/O. The I/O is mapped into OCS Register space, in three separate areas - digital/ analog I/O, high-speed counter I/O, and high-speed output I/O. Digital/ analog I/O location is fixed starting at 1, but the high-speed counter and high-speed output references may be mapped to any open register location. For more details, see the EXL10 OCS User's Manual [MAN1029].

6 ANALOG IN TRANZORB FAILURE

A common cause of Analog Input Tranzorb Failure on Analog Inputs Model 2, 3, 4 & 5: If a 4-20mA circuit is initially wired with loop power, but without a load, the Analog input could see 24VDC. This is higher than the rating of the tranzorb. This can be solved by NOT connecting loop power prior to load connection, or by installing a low-cost PTC in series between the load and analog input. **Digi-Key BC2316-ND**

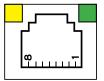

7 BATTERY

The EXL10 has an advanced battery system that uses a rechargeable lithium battery. The battery powers the real time clock when power is removed, and it is needed for register data retention. Please reference the EXL10 User Manual [MAN1029] which provides instructions on how to replace the battery.

NOTE: For detailed rechargeable battery information, refer to the Battery Manual **[MAN1142]**.

4.4 - Ethernet Communications

Green LED indicates link - when illuminated, data communication is available.

Yellow LED indicates activity - when flashing, data is in transmission.

8 DIMENSIONS & INSTALLATION

8.1 - Dimensions

8.2 - Installation Procedure

- The EXL10 utilizes a clip installation method to ensure a robust and watertight seal to the enclosure. Please follow the steps below for the proper installation and operation of the unit.
- This equipment is suitable for Class I, Division 2, Groups A, B, C and D or non-hazardous locations only.
- Digital outputs shall be supplied from the same source as the operator control station.
- Jumpers on connector JP1 shall not be removed or replaced while the circuit is live unless the area is known to be free of ignitable concentrations of flammable gases or vapors.
- Carefully locate an appropriate place to mount the EXL10. Be sure 1. to leave enough room at the top of the unit for insertion and removal of the microSD^{\rm TM} card.
- Carefully cut the host panel per the diagram, creating a 2. 216mm x 288.5mm +/-0.1 mm opening into which the EXL10 may be installed. If the opening is too large, water may leak into the enclosure, potentially damaging the unit. If the opening is too small, the OCS may not fit through the hole without damage.
- Remove any burrs and or sharp edges and ensure the panel is not 3. warped in the cutting process.
- 4. Remove all Removable Terminals from the EXL10. Insert the EXL10 through the panel cutout (from the front). The gasket must be between the host panel and the EXL10.
- Install and tighten the four mounting clips (provided in the box) 5 until the gasket forms a tight seal.
- NOTE: Max torque is 0.8 to 1.13 N m, or 7-10 in-lbs. 6. Reinstall the EXL10 I/O Removable Terminal Blocks. Connect communications cables to the serial port, USB ports, Ethernet port, and CAN port as required.

9 SAFETY

9.1 - WARNINGS

- 1. To avoid the risk of electric shock or burns, always connect the safety (or earth) ground before making any other connections.
- To reduce the risk of fire, electrical shock, or physical injury, it is strongly recommended 2. to fuse the voltage measurement inputs. Be sure to locate fuses as close to the source as possible.
- Replace fuse with the same type and rating to provide protection against risk of fire and 3. shock hazards. In the event of repeated failure, do NOT replace the fuse again as repeated failure
- 4. indicates a defective condition that will NOT clear by replacing the fuse
- Only qualified electrical personnel familiar with the construction and operation of this equipment and the hazards involved should install, adjust, operate, or service this equip-5. ment. Read and understand this manual and other applicable manuals in their entirety before proceeding. Failure to observe this precaution could result in severe bodily injury or loss of life
- 6 WARNING - Battery may explode if mistreated. Do not recharge, disassemble, or dispose of in fire.
- 7. WARNING - EXPLOSION HAZARD - Batteries must only be changed in an area known to be non-hazardous

9.2 - FCC COMPLIANCE

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

- This device may not cause harmful interference
- This device must accept any interference received, including interference that may 2. cause undesired operation

9.3 - PRECAUTIONS

All applicable codes and standards need to be followed in the installation of this product. Adhere

- to the following safety precautions whenever any type of connection is made to the module: 1. Connect the safety (earth) ground on the power connector first before making any other connections
 - When connecting to the electric circuits or pulse-initiating equipment, open their 2. related breakers.
 - 3
 - Do NOT make connection to live power lines. Make connections to the module first; then connect to the circuit to be monitored. 4 5. Route power wires in a safe manner in accordance with good practice and local codes
 - Wear proper personal protective equipment including safety glasses and insulated 6. gloves when making connections to power circuits.
 - 7 Ensure hands, shoes, and floor are dry before making any connection to a power line.
 - Make sure the unit is turned OFF before making connection to terminals. 8
 - Make sure all circuits are de-energized before making connections. Before each use, inspect all cables for breaks or cracks in the insulation. Replace 10.
 - immediately if defective. Use copper conductors in Field Wiring only, 60/75°C. 11
 - Use caution when connecting controllers to PCs via serial or USB. PCs, especially 12. laptops may use "floating power supplies" that are ungrounded. This could cause a damaging voltage potential between the laptop and controller. Ensure the controller and laptop are grounded for maximum protection. Consider using a USB isolator due to voltage potential differences as a preventative measure.
