1 Introduction

Thank you for purchasing the Moxa DA-681 Series of x86 ready-to-run embedded computers. This manual introduces the software configuration and management of the DA-681-LX, which runs the Linux operating system. For hardware installation, connector interfaces, setup, and upgrading the BIOS, please refer to the "DA-681 Series Hardware User's Manual."

Linux is an open, scalable operating system that allows you to build a wide range of innovative, small footprint devices. Software written for desktop PCs can be easily ported to the embedded computer with a GNU cross compiler and a minimum of source code modifications. A typical Linux-based device is designed for a specific use, and is often not connected to other computers, or a number of such devices connect to a centralized, front-end host. Examples include enterprise tools such as industrial controllers, communications hubs, point-of-sale terminals, and display devices, which include HMIs, advertisement appliances, and interactive panels.

This chapter covers the following topics:

- **Overview**
- Product Features
- □ Software Specifications
- **Read-only Root File System**
- □ Software Components

Overview

The DA-681 embedded computer is based on the Intel Celeron M processor and 910GMLE chipset, which supports standard X86 VGA, USB, PS/2 keyboard/mouse, 6 10/100 Mbps LAN ports, and SATA disk interface. In addition, the DA-681 supports a CompactFlash Socket and preinstalled embedded ready-to-run operating system. Programmers will find the full-function development kit a great benefit for developing software and building reliable communication applications.

The housing is a standard 1U, 19-inch wide rack-mounted rugged enclosure. This robust, rackmountable design provides the hardened protection needed for industrial environment applications.

Moreover, the DPP-T models are in full compliance with IEC 61850-3 standards to meet the demands of power substation automation.

Product Features

The DA-681 Series Basic System has the following features:

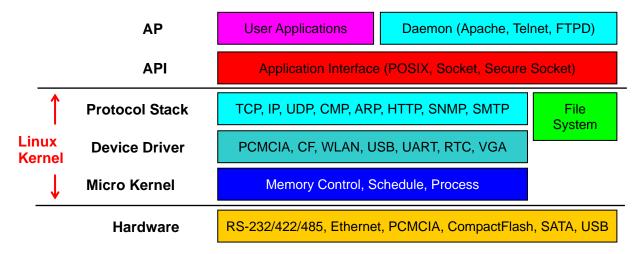

- IEC 61850-3 certified for power substation automation systems (DPP-T models only)
- Intel Celeron M 1 GHz processor with 400 MHz FSB
- Intel 910GMLE + ICH6M chipset
- 200-pin DDR2 SODIMM socket supporting DDR2 400 up to 1 GB (built-in 512 MB)
- 6 Ethernet ports for network redundancy
- 1 CompactFlash socket
- 1 SATA connector for storage expansion
- 4 RS-232 and 8 RS-485 serial ports (supports most nonstandard baudrates in this range)
- 2 USB 2.0 ports for high speed peripherals
- 19-inch rackmount, 1U high form factor
- Fanless Design
- 100/240 VAC/VDC power input (single power and dual power models available)

ATTENTION

Refer to section "Baud Rate Speed" for calculation of baud rate speed supported.

Software Specifications

The Linux operating system pre-installed on the DA-681 embedded computer is the **Debian Etch 4.0r5** distribution. The Debian project is a worldwide group of volunteers who endeavor to produce an operating system distribution that composed entirely of free software. The Debian GNU/Linux follows the standard Linux architecture, making it easy to use programs that meet the POSIX standard. In addition to Standard POSIX APIs, device drivers for Moxa UART and other special peripherals are also included. An example software architecture is shown below:

ATTENTION

Refer to <u>http://www.debian.org/</u> and <u>http://www.gnu.org/</u> for information and documentation of the Debian GNU/Linux and free software concept.

ATTENTION

The above software architecture is only an example. Different models or different build revisions of the Linux operating system may include components not shown in the above graphic.

Read-only Root File System

The pre-installed root file system is protected in a read-only partition to prevent file system crash problems normally caused by power loss. But some directories or files, such as **/home, /root, /var**, **/etc/network/**, **/etc/ppp/**, **/ect/openvpn/**, and **/etc/resolv.conf**, which need write permission, are located in another writable partition and formatted with the EXT2 file system. You can read/write above files or directories directly without re-mounting it.

Software Components

The DA-681-LX pre-installed Debian Etch 4.0r2 Linux distribution has the following software components:

Component	Version	Description	
acpid	1.0.4-5	Utilities for using ACPI power management	
adduser	3.102	Add and remove users and groups	
apache2	2.2.3-4+etch6	Next generation, scalable, extendable web server	
apache2-mpm-prefork	2.2.3-4+etch6	Traditional model for Apache HTTPD 2.1	
apache2-utils	2.2.3-4+etch6	Utility programs for webservers	
apache2.2-common	2.2.3-4+etch6	Next generation, scalable, extendable web server	
apt	0.6.46.4-0.1	Advanced front-end for dpkg	
apt-utils	0.6.46.4-0.1	APT utility programs	
aptitude	0.4.4-4	Terminal-based apt frontend	
base-files	4	Debian base system miscellaneous files	
base-passwd	3.5.11	Debian base system master password and group	
bash	3.1dfsg-8	The GNU Bourne Again SHell	
binutils	2.17-3	The GNU assembler, linker and binary utilities	
bridge-utils	1.2-1	Utilities for configuring the Linux ethernet bridge	
bsdmainutils	6.1.6	Collection of more utilities from FreeBSD	
bsdutils	2.12r-19etch1	Basic utilities from 4.4BSD-Lite	
busybox	1.1.3-4	Tiny utilities for small and embedded system	
console-common	0.7.69	Basic infrastructure for text console configuration	
console-data	1.01-7	Keymaps, fonts, charset maps, fallback table for console-tools	
console-tools	0.2.3dbs-65	Linux console and font utilities	
coreutils	5.97-5.3	The GNU core utilities	
cpio	2.6-18.1+etch1	GNU cpio a program to manage archives of files	
срр	4.1.1-15	The GNU C preprocessor (cpp)	
cpp-4.1	4.1.1-21	The GNU C preprocessor	
cron	3.0pl1-100	Management of regular background processing	
debconf	1.5.11etch1	Debian configuration management system	

Component	Version	Description	
debconf-i18n	1.5.11etch1	Full internationalization support for debcon	
debian-archive- keyring	2007.07.31~etc	GnuPG archive keys of the Debian archive	
debianutils	2.17	Miscellaneous utilities specific to Debian	
dhcp3-client	3.0.4-13	DHCP Client	
dhcp3-common	3.0.4-13	Common files used by all the dhcp3* packages	
dictionaries-common	0.70.10	Common utilities for spelling dictionary tools	
diff	2.8.1-11	File comparison utilities	
dmidecode	2.8-4	Dump Desktop Management Interface data	
dnsutils	9.3.4-2etch1	Clients provided with BIND	
dpkg	1.13.25	Package maintenance system for Debian	
dselect	1.13.25	User tool to manage Debian packages	
e2fslibs	1.39+1.40-WIP- 2006.	11.14+dfsg-2etch1 ext2 filesystem libraries	
e2fsprogs	1.39+1.40-WIP- 2006.	11.14+dfsg-2etch1 ext2 file system utilities and libraries	
findutils	4.2.28-1etch1	Utilities for finding filesfind, xargs, an	
ftp	0.17-16	The FTP client	
g++	4.1.1-15	The GNU C++ compiler	
g++-4.1	4.1.1-21	The GNU C++ compiler	
gcc	4.1.1-15	The GNU C compiler	
gcc-4.1	4.1.1-21	The GNU C compiler	
gcc-4.1-base	4.1.1-21	The GNU Compiler Collection (base package)	
gnupg	1.4.6-2	GNU privacy guard - a free PGP replacement	
gpgv	1.4.6-2	GNU privacy guard - signature verification tool	
grep	2.5.1.ds2-6	GNU grep, egrep and fgrep	
grub	0.97-27etch1	GRand Unified Bootloader	
gzip	1.3.5-15	The GNU compression utility	
hostname	2.93	Utility to set/show the host name or domain	
ifrename	28-1+etchnhalf	Rename network interfaces based on various static criteria	
ifupdown	0.6.8	High level tools to configure network interfaces	
initramfs-tools	0.85i	Tools for generating an initramfs	
initscripts	2.86.ds1-38+et	Scripts for initializing and shutting down the system	
iproute	20061002-3	Professional tools to control the networking in Linux kernels	
iptables	1.3.6.0debian1	Administration tools for packet filtering and NAT netfilter and iptables provide a Linux kernel framework for stateful and stateless packet filtering,	

Component	Version	Description	
		network and port address translation, and other IP packet manipulation. The framework is the successor to ipchains.	
iputils-ping	20020927-6	Tools to test the reachability of network hosts	
klibc-utils	1.4.34-2	Small statically-linked utilities built with klibc	
klogd	1.4.1-18	Kernel Logging Daemon	
libacl1	2.2.41-1	Access control list shared library	
libattr1	2.4.32-1	Extended attribute shared library	
libbind9-0	9.3.4-2etch1	BIND9 Shared Library used by BIND	
libblkid1	1.39+1.40-WIP- 2006.	11.14+dfsg-2etch1 block device id library	
klibc	1.0.3-6	Small statically-linked utilities built with klibc	
libc6	2.3.6.ds1-13etch5	GNU C Library: Shared libraries	
libc6-dev	2.3.6.ds1-13etch5	GNU C Library: Development Libraries and Header Files	
libc6-i686	2.3.6.ds1-13etch5	GNU C Library: Shared libraries [i686 optimized]	
libcap1	1.10-14	Support for getting/setting POSIX.1e capabilities	
libcomerr2	1.39+1.40-WIP- 2006.	11.14+dfsg-2etch1 common error description library	
libconsole	0.2.3dbs-65	Shared libraries for Linux console and font	
libcupsys2	1.2.7-4etch2	Common UNIX Printing System(tm) - libs	
libdb4.2	4.2.52+dfsg-2	Berkeley v4.2 Database Libraries [runtime]	
libdb4.3	4.3.29-8	Berkeley v4.3 Database Libraries [runtime]	
libdb4.4	4.4.20-8	Berkeley v4.4 Database Libraries [runtime]	
libdevmapper1.02	1.02.08-1	The Linux Kernel Device Mapper userspace library	
libdns22	9.3.4-2etch1	DNS Shared Library used by BIND	
libedit2	2.9.cvs.20050518- 2.2	BSD editline and history libraries	
libevent1	1.1a-1	An asynchronous event notification library	
libgc1c2	6.8-1	Conservative garbage collector for C and C++	
libgcc1	4.1.1-21	GCC support library	
libgcrypt11	1.2.3-2	LGPL Crypto library - runtime library	
libgdbm3	1.8.3-3	GNU dbm database routines (runtime version)	
libgnutls13	1.4.4-3	The GNU TLS library - runtime library	
libgpg-error0	1.4-1	Library for common error values and messages	
libgpmg1	1.19.6-25	General Purpose Mouse - shared library	
libgssapi2	0.10-4	A mechanism-switch gssapi library	
libidn11	0.6.5-1	GNU libidn library, implementation of IETF I	

Component	Version	Description	
libisc11	9.3.4-2etch1	ISC Shared Library used by BIND	
libisccc0	9.3.4-2etch1	Command Channel Library used by BIND	
libisccfg1	9.3.4-2etch1	Config File Handling Library used by BIND	
libiw28	28-1	Wireless tools - library	
libklibc	1.4.34-2	Minimal libc subset for use with initramfs	
libkrb53	1.4.4-7etch4	MIT Kerberos runtime libraries	
libldap2	2.1.30-13.3	OpenLDAP libraries	
liblocale-gettext-perl	1.05-1	Using libc functions for internationalization in Perl	
liblockfile1	1.06.1	NFS-safe locking library, includes dotlockfile program	
liblwres9	9.3.4-2etch1	Lightweight Resolver Library used by BIND	
liblzo1	1.08-3	Data compression library (old version)	
liblzo2-2	2.02-2	Data compression library	
libmagic1	4.17-5etch3	File type determination library using "magic" numbers	
libmysqlclient15off	5.0.32-7etch5	mysql database client library	
libncurses5	5.5-5	Shared libraries for terminal handling	
libncursesw5	5.5-5	S Shared libraries for terminal handling (wide character support)	
libnet-lite-ftp-perl	0.47-2	Perl FTP client with support for TLS	
libnet-ssleay-perl	1.30-1	Perl module for Secure Sockets Layer (SSL)	
libnet-telnet-perl	3.03-1	Script telnetable connections	
libnewt0.52	0.52.2-10	Not Erik's Windowing Toolkit - text mode windowing with slang	
libnfsidmap2	0.18-0	An nfs idmapping library	
libopencdk8	0.5.9-2	Open Crypto Development Kit (OpenCDK) (runtime)	
libpam-modules	0.79-5	Pluggable Authentication Modules for PAM	
libpam-runtime	0.79-5	Runtime support for the PAM library	
libpam0g	0.79-5	Pluggable Authentication Modules library	
libpcap0.8	0.9.5-1	System interface for user-level packet capture	
libpci2	2.1.11-3	Obsolete shared library for accessing pci devices	
libpcre3	6.7+7.4-3	Perl 5 Compatible Regular Expression Library	
libpopt0	1.10-3	lib for parsing cmdline parameters	
libpq4	8.1.11-0etch1	PostgreSQL C client library	
libreadline5	5.2-2	GNU readline and history libraries, run-time	
libroken16-heimdal	0.7.2.dfsg.1-10	Libraries for Heimdal Kerberos	
librpcsecgss3	0.14-2etch3	Allows secure rpc communication using the	

Component	Version	Description	
		rpcsec_gss protocol	
libsasl2	2.1.22.dfsg1-8	Authentication abstraction library	
libsasl2-2	2.1.22.dfsg1-8	Authentication abstraction library	
libselinux1	1.32-3	SELinux shared libraries	
libsemanage1	1.8-1	Shared libraries used by SELinux policy manipulation tools	
libsensors3	2.10.1-3	Library to read temperature/voltage/fan sensors	
libsepol1	1.14-2	Security Enhanced Linux policy library for changing policy binaries	
libsigc++-2.0-0c2a	2.0.17-2	Type-safe Signal Framework for C++ - runtime	
libslang2	2.0.6-4	The S-Lang programming library - runtime version	
libslp1	1.2.1-6.2	OpenSLP libraries	
libsnmp-base	5.2.3-7etch2	NET SNMP (Simple Network Management Protocol) MIBs and Docs	
libsnmp9	5.2.3-7etch2	NET SNMP (Simple Network Management Protocol) MIBs and Docs	
libss2	1.39+1.40-WIP- 2006.	11.14+dfsg-2etch1 command-line interface parsing library	
libssl0.9.8	0.9.8c-4etch1	SSL shared libraries	
libssp0	4.1.1-21	GCC stack smashing protection library	
libstdc++6	4.1.1-21	The GNU Standard C++ Library v3	
libstdc++6-4.1-dev	4.1.1-21	The GNU Standard C++ Library v3 (development files)	
libsysfs2	2.1.0-1	Interface library to sysfs	
libtasn1-3	0.3.6-2	Manage ASN.1 structures (runtime)	
libtasn1-3-bin	0.3.6-2	Manage ASN.1 structures (binaries)	
libtext-charwidth-perl	0.04-4	Get display widths of characters on the term	
libtext-iconv-perl	1.4-3	Converts between character sets in Perl	
libtext-wrapi18n-perl	0.06-5	Internationalized substitute of Text:Wrap	
libusb-0.1-4	0.1.12-5	userspace USB programming library	
libuuid1	1.39+1.40-WIP- 2006.	11.14+dfsg-2etch1 universally unique id library	
libvolume-id0	0.105-4	libvolume_id shared library	
libwrap0	7.6.dbs-13	Wietse Venema's TCP wrappers library	
linux-image-2.6-686	2.6.18+6etch2	Linux kernel 2.6 image on PPro/Celeron/PII/PIII/P4	
linux-image-2.6.18-5- 686	2.6.18.dfsg.1-17	Linux 2.6.18 image on PPro/Celeron/PII/PIII/P4	
linux-kernel-headers	2.6.18-7	Linux Kernel Headers for development	
locales	2.3.6.ds1-13etch5	GNU C Library: National Language (locale) data [support]	

Version	Description	
0.1.10	Programs for locking and unlocking files and mailboxes	
4.0.18.1-7	System login tools	
3.7.1-3	Log rotation utility	
3.1-23.2etch1	Linux Standard Base 3.1 init script function	
3.81-2	The GNU version of the "make" utility.	
2.3.1-83	Creates device files in /dev	
2.39-1	Manual pages about using a GNU/Linux system	
1.3.3-11	A pattern scanning and text processing language	
3.39-1	MIME files "mime.types" & "mailcap", and support programs	
2.2-5	Friendly menu driven serial communication program	
1.5-2	Makes unique filenames for temporary files	
0.3.1	Device Driver Configuration	
3.3-pre4-2	Tools for managing Linux kernel modules	
2.12r-19etch1	Tools for mounting and manipulating filesystems	
5.0.32-7etch8	Mysql database common files (e.g. /etc/mysql my.cnf)	
5.5-5	Descriptions of common terminal types	
5.5-5	Terminal-related programs and man pages	
1.60-17	The NET-3 networking toolkit	
4.29	Basic TCP/IP networking system	
1.0.10-6+etch.1	NFS support files common to client and server	
0.20050402-6	The OpenBSD Internet Superserver	
4.3p2-9	Secure shell client, an rlogin/rsh/rcp replacement	
4.3p2-9	Secure shell server, an rshd replacement	
0.9.8c-4etch3	Secure Socket Layer (SSL) binary and related cryptographic tools	
2.0.9-4etch1	Virtual Private Network daemon	
4.0.18.1-7	Change and administer password and group data	
2.2.4~pre4-1	Linux PCI Utilities	
5.8.8-7etch3	Larry Wall's Practical Extraction and Report	
5.8.8-7etch3	The Pathologically Eclectic Rubbish Lister	
5.8.8-7etch3	Core Perl modules	
5-26	The RPC portmapper	
2.4.4rel-8	Point-to-Point Protocol (PPP) daemon	
2.3.15.etch1	A text menu based utility for configuring ppp	
	0.1.10 4.0.18.1-7 3.7.1-3 3.1-23.2etch1 3.81-2 2.3.1-83 2.39-1 1.3.3-11 3.39-1 2.2-5 1.5-2 0.3.1 3.3-pre4-2 2.12r-19etch1 5.0.32-7etch8 5.5-5 1.60-17 4.29 1.0.10-6+etch.1 0.20050402-6 4.3p2-9 0.9.8c-4etch3 2.0.9-4etch1 4.0.18.1-7 2.2.4~pre4-1 5.8.8-7etch3 5.8.8-7etch3 5.8.8-7etch3 5.9.26 2.4.4rel-8	

Component	Version	Description	
pppoe	3.8-1.1	PPP over Ethernet driver	
procps	3.2.7-3	/proc file system utilities	
proftpd	1.3.0-19etch1	Versatile, virtual-hosting FTP daemon	
readline-common	5.2-2	GNU readline and history libraries, common files	
sed	4.1.5-1	The GNU sed stream editor	
snmp	5.2.3-7etch4	NET SNMP (Simple Network Management Protocol) Apps	
snmpd	5.2.3-7etch4	NET SNMP (Simple Network Management Protocol) Agents	
ssh	4.3p2-9etch3	Secure shell client and server (transitional package)	
ssl-cert	1.0.14	Simple debconf wrapper for openssl	
strace	4.5.14-2	A system call tracer	
sysklogd	1.4.1-18	System Logging Daemon	
sysv-rc	2.86.ds1-38+et	System-V-like runlevel change mechanism	
sysvinit	2.86.ds1-38+et	System-V-like init utilities	
sysvinit-utils	2.86.ds1-38+et	System-V-like utilities	
tar	1.16-2etch1	GNU tar	
tcpd	7.6.dbs-13	Wietse Venema's TCP wrapper utilities	
tcpdump	3.9.5-2etch1	A powerful tool for network monitoring and data acquisition	
telnet	0.17-34	The telnet client	
telnetd	0.17-34	The telnet server	
tftpd	0.17-15	Trivial file transfer protocol server	
time	1.7-21	The GNU time program for measuring cpu resource usage	
traceroute	1.4a12-21	Traces the route taken by packets over a TCP	
tzdata	2008e-1etch3	Time Zone and Daylight Saving Time Data	
ucf	2.0020	Update Configuration File: preserves user changes to config files.	
udev	0.105-4	/dev/ and hotplug management daemon	
update-inetd	4.27-0.5	inetd.conf updater	
usbmount	0.0.14.1	Automatically mount and unmount USB mass storage devices	
usbutils	0.72-7	USB console utilities	
util-linux	2.12r-19etch1	Miscellaneous system utilities	
vim	7.0-122+1etch3	Vi IMproved - enhanced vi editor	
vim-common	7.0-122+1etch3	Vi IMproved - Common files	
vim-runtime	7.0-122+1etch3	Vi IMproved - Runtime files	

DA-681 Series Linux User's Manual

Component	Version	Description
vim-tiny	7.0-122+1etch3	Vi IMproved - enhanced vi editor - compact version
w3m	0.5.1-5.1	WWW browsable pager with excellent tables/frames support
wget	1.10.2-2	Retrieves files from the web
whiptail	0.52.2-10	Displays user-friendly dialog boxes from shell scripts
whois	4.7.20	The GNU whois client
zlib1g	1.2.3-13	Compression library - runtime

Software Configuration

In this chapter, we explain how to operate a DA-681-LX computer directly or from a PC near you. There are three ways to connect to the DA-681-LX computer: through VGA monitor, by using Telnet over the network, or by using an SSH console from a Windows or Linux machine. This chapter describes basic Linux operating system configurations. The advanced network management and configuration will be described in the next chapter "Managing Communications."

This chapter covers the following topics:

- □ Starting from a VGA Console
- **Connecting from a Telnet Console**
- **Connecting from an SSH Console**
 - Windows Users
 - ➤ Linux Users
- □ Adjusting the System Time
 - Setting the Time Manually

Starting from a VGA Console

Connect the display monitor to the DA-681-LX VGA connector, and then power it up by connecting it to the power adaptor. It takes about 30 to 60 seconds for the system to boot up. Once the system is ready, a login screen will appear on your monitor.

To log in, type the login name and password as requested. The default values are both root.

Login: root

Password: root

```
login as: root
root@192.168.3.12's password:
Last login: Mon Jan 22 19:02:16 2007 from 192.168.3.120

Mount user file system.
Moxa:~#
```

Connecting from a Telnet Console

The DA-681-LX computer comes with 6 10/100 Mbps Ethernet ports named LAN1 to LAN6. The default IP addresses and netmasks of the network interfaces are as follows:

	Default IP Address	Netmask
LAN 1	192.168.3.127	255.255.255.0
LAN 2	192.168.4.127	255.255.255.0
LAN 3	192.168.5.127	255.255.255.0
LAN 4	192.168.6.127	255.255.255.0
LAN 5	192.168.7.127	255.255.255.0
LAN 6	192.168.8.127	255.255.255.0

Before using the Telnet client, you should change the IP address of your development workstation so that the network ports are on the same subnet as the IP address for the LAN port that you connect to. For example, if you connect to LAN 1, you could set your PC's IP address to 192.168.3.126, and the netmask to 255.255.255.0. If you connect to LAN 2, you can set your PC's IP address to 192.168.4.126, and the netmask to 255.255.255.0.

Use a cross-over Ethernet cable to connect your development workstation directly to the target computer, or use a straight-through Ethernet cable to connect the computer to a LAN hub or switch. Next, use a Telnet client on your development workstation to connect to the target computer. After a connection has been established, type the login name and password as requested to log on to the computer. The default values are both **root**.

Login: root

Password: root

ATTENTION

If you cannot get connected on the first try, re-check the IP address and netmask settings, and then unplug and re-plug the DA-681-LX's power cord.

Connecting from an SSH Console

The DA-681-LX computer supports an SSH Console to offer users with better security over the network compared to Telnet.

Windows Users

Click on the link http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html to download **PuTTY** (free software) to set up an SSH console for the DA-681-LX in a Windows environment. The following screen shows an example of the configuration that is required.

🕵 PuTTY Configuration	×
Category:	
	Basic options for your PuTTY session
Logging	Specify the destination you want to connect to
Keyboard	Host Name (or IP address) Port
Bell	192.168.3.127 22
Features	Connection type: ○ Raw ○ Telnet ○ Rlogin ● SSH ○ Serial
Window Appearance Behaviour	○ <u>R</u> aw ○ <u>I</u> elnet ○ Rlogin ○ <u>S</u> SH ○ Serial Lead, save or delete a stored session
Translation	Sav <u>e</u> d Sessions
- Selection	192.168.3.127
Colours	Default Settings
Data	192.168.1.80
Proxy	192.168.30.109 192.168.30.109
Telnet	192.168.30.111 192.168.30.121
	192.168.30.125
Serial	Class window on suite
	Close <u>w</u> indow on exit: Always Never Only on clean exit
About	<u> </u>

Linux Users

From a Linux machine, use the ssh command to access the DA-681-I-LX's console utility via SSH.

#ssh 192.168.3.127

Select yes to open the connection.

```
[root@bee_notebook root]# ssh 192.168.3.127
The authenticity of host `192.168.3.127 (192.168.3.127)'
can't be established.
RSA key fingerprint is
8b:ee:ff:84:41:25:fc:cd:2a:f2:92:8f:cb:1f:6b:2f.
Are you sure you want to continue connection (yes/no)? yes_
```

Adjusting the System Time

The DA-681-LX has two time settings. One is the system time, and the other is provided by an RTC (Real Time Clock) built into the DA-681- LX's hardware.

Setting the Time Manually

Use the **date** command to query the current system time or set a new system time. Use **hwclock** to query the current RTC time or set a new RTC time.

Use the following command to set the system time.

date MMDDhhmmYYYY

MM: Month DD: Date hhmm: Hour and Minute YYYY: Year

Use the following command to write the current system time to the RTC.

hwclock -w

```
Moxa:~# date

Fri Jun 23 23:30:31 CST 2000

Moxa:~# hwclock

Fri Jun 23 23:30:35 2000 -0.557748 seconds

Moxa:~# date 120910002004

Thu Dec 9 10:00:00 CST 2004

Moxa:~# hwclock -w

Moxa:~# date ; hwclock

Thu Dec 9 10:01:07 CST 2004

Thu Dec 9 10:01:08 2004 -0.933547 seconds

Moxa:~#
```

NTP Client

The DA-681-LX has a built-in NTP (Network Time Protocol) client that is used to initialize a time request to a remote NTP server. Use **ntpdate** to update the system time.

#ntpdate time.stdtime.gov.tw

#hwclock -w

Visit http://www.ntp.org for more information about NTP and NTP server addresses.

```
Moxa:~# date ; hwclock
Sat Jan 1 00:00:36 CST 2000
Sat Jan 1 00:00:37 2000 -0.772941 seconds
Moxa:~#
Moxa:~# ntpdate time.stdtime.gov.tw
9 Dec 10:58:53 ntpdate[207]: step time server 220.130.158.52
offset 155905087.9
84256 sec
Moxa:~#
Moxa:~# hwclock -w
Moxa:~# date ; hwclock
Thu Dec 9 10:59:11 CST 2004
Thu Dec 9 10:59:12 2004 -0.844076 seconds
Moxa:~#
```

ATTENTION

Before using the NTP client utility, check your IP address and network settings to make sure an Internet connection is available.

Updating the Time Automatically

This section describes how to use a shell script to update the time automatically.

Example shell script for updating the system time periodically

#!/bin/sh ntpdate time.nist.gov # You can use the time server's ip address or domain # name directly. If you use domain name, you must # enable the domain client on the system by updating # /etc/resolv.conf file. hwclock -w sleep 100 # Updates every 100 seconds. The min. time is 100 seconds. # Change 100 to a larger number to update RTC less often.

Save the shell script using any file name. For example, fixtime.

How to run the shell script automatically when the kernel boots up

Because the root file system is mounted in Read-only mode, we need to re-mount it using writable permission.

mount -o remount,rw /dev/hda1 /

Copy the example shell script **fixtime** to directory **/etc/init.d**, and then use **chmod 755 fixtime** to change the shell script mode.

chmod 755 fixtime

Next, use vi editor to edit the file /etc/inittab.

vi /etc/inittab

Add the following line to the bottom of the file:

ntp: 2345 : respawn : /etc/init.d/fixtime

After you finish writing or modifying the code, remember to execute "umount /" to change the root directory back to Read-only mode.

umount /

Use the command **#init q** to re-initialize the kernel.

init q

Enabling and Disabling Daemons

The following daemons are enabled when the DA-681-LX boots up for the first time.

- snmpd SNMP Agent Daemon
- telnetd Telnet Server/Client Daemon
- inetd Internet Daemons
- ftpd FTP Server/Client Daemon
- sshd
 Secure Shell Server Daemon
- httpd Apache WWW Server Daemon

Type the command **ps** –ef to list all processes currently running.

Moxa:~# ps -ef									
UID	PID PF	DID	С	STIME	TTY	TIME CMD			
root	1	0	0	Feb18	?	00:00:01 init [2]			
root	2	1	0	Feb18	?	00:00:00 [migration/0]			
root	3	1	0	Feb18	?	00:00:00 [ksoftirqd_0]			
root	4	1	0	Feb18	?	00:00:00 [events/0]			
root	5	1	0	Feb18	?	00:00:00 [khelper]			
root	б	1	0	Feb18	?	00:00:00 [kthread]

root	146	6	0	Feb18	?	00:00:00 [aio/01]			
root	622	6	0	Feb18	?	00:00:00 [khubd]			
root	763	6	0	Feb18	?	00:00:00 [scsi_eh_0]			
root	765	6	0	Feb18	?	00:00:00 [usb-storage]			
root	1119	1	0	Feb18	?	00:00:00 udevddaemon			
root	1527	6	0	Feb18	?	00:00:00 [kpsmoused]			
root	1754	6	0	Feb18	?	00:00:00 [kmirrord]			
daemon	2094	1	0	Feb18	?	00:00:00 /sbin/portmap			
root	2311	1	0	Feb18	?	00:00:00			
/usr/sbin/	acpid								
-c /etc/ac	pi/evemt:	5 -S	/v	ar/run/	'acpic	l.socket			
root	2318	1	0	Feb18	?	00:00:00			
/usr/sbin/	inetd								

To run a private daemon, you can edit the file **rc.local** as follows:

1. Because the root file system is mounted in Read-only mode, you need to re-mount it with write permission.

Moxa:~# mount -o remount,rw /dev/hda1 /

2. Type cd /etc/ to change directories.

Moxa:~# cd /etc/

3. Type vi rc.local to edit the configuration file with vi editor.

Moxa:/etc/# vi rc.local

4. Next, add the application daemon that you want to run. We use the example program **tcps2-release** to illustrate, and configure it to run in the background.

```
# !/bin/sh
# Add the daemon you want to run
/root/tcps2-release &
```

DA-681 Series Linux User's Manual

5. After you finish writing or modifying the code, remember to execute "umount /" to change the root directory back to Read-only mode.

Moxa:~# umount /

6. You should be able to find the enabled daemon after you reboot the system.

Moxa:~# ps	-ef					
UID	PID	PPID	C	C STIME	TTY	TIME CMD
root	1	0	С	Feb18	?	00:00:01 init [2]

Setting the Run-Level

To set the Linux run-level and execution priority of a program, use the following command (because the root file system is mounted in Read-only mode, we need to re-mount it with write permission).

Moxa:~# mount -o remount,rw /dev/hda1 /

Edit a shell script to execute /root/tcps2-release and save to tcps2 as an example. This program can be found in Example Directory in CD-ROM.

#cd /etc/rc2.d

#ln -s /etc/root/tcps2 S60tcps2

or

#ln -s /etc/root/tcps2 k30tcps2

```
Moxa:~# cd /etc/rc2.d
Moxa:/etc/rc2.d#
Moxa:/etc/rc2.d# ls
S19nfs-common
                   S25nfs-user-server S99showreadyled
S20snmpd
                   S55ssh
S24pcmcia
                   S99rmnologin
Moxa:/etc/rc2.d#
Moxa:/etc/rc2.d# ln -s /root/tcps2-release S60tcps2
Moxa:/etc/rc2.d# ls
S19nfs-common
                   S25nfs-user-server S99rmnologin
S20snmpd
                   S55ssh
                                       S99showreadyled
S24pcmcia
                   S60tcps2
Moxa:/etc/rc2.d#
```

The command **SxxRUNFILE** has the following meaning:

S:	Start the run file while Linux boots up.
xx:	A number between 00-99. The smaller number has a higher priority.
RUNFILE:	The script file name

The command **KxxRUNFILE** has the following meaning:

K:	Start the run file while Linux shuts down or halts.
xx:	A number between 00-99. The smaller number has a higher priority.
RUNFILE:	The script file name

To remove the daemon, remove the run file from /etc/rc2.d by using the following command:

rm -f /etc/rc2.d/S60tcps2

After you finish writing or modifying the code, remember to execute "umount /" to change the root directory back to Read-only mode.

Moxa:~# umount /

Cron—Daemon for Executing Scheduled Commands

The Cron daemon will search /etc/crontab for crontab files, which are named after accounts in /etc/passwd.

Cron wakes up every minute and checks each command to see if it should be run in that minute. When executing commands, output is mailed to the owner of the **crontab** (or to the user named in the MAILTO environment variable in the **crontab**, if such a user exists).

Modify the file **/etc/crontab** to set up your scheduled applications. **Crontab** files have the following format:

mm	h	dom	mon	dow	user	command
minute	hour	date	month	week	user	command
0-59	0-23	1-31	1-12	0-6 (0 is Sunday)		

For example, if you want to launch a program at 8:00 every day

#minute	hour	date	month	week	user	command
*	8	*	*	*	root	/path/to/your/program

The following example demonstrates how to use **Cron** to update the system time and RTC time every day at 8:00.

1. Write a shell script named fixtime.sh and save it to /home/.

```
#!/bin/sh
ntpdate time.nist.gov
hwclock -w
exit 0
```

2. Change mode of fixtime.sh

chmod 755 fixtime.sh

3. Modify /etc/crontab file to run fixtime.sh at 8:00 every day.

Add the following line to the end of crontab:

* 8 * * * root /home/fixtime.sh

Inserting an SATA Hard Drive into the Computer

The DA-681 offers one hard drive connector supporting a SATA-based disk that can be added to the computer. Follow the next step.

1. Change the access right of the file system mount -o remount,rw /dev/hda1 /

Then use mount command to check if the status has been changed from **read only** to **read and** write.

```
Moxa:~# mount
rootfs on / type rootfs (rw)
none on /sys type sysfs (rw)
none on /proc type proc (rw)
udev on /dev type tmpfs (rw)
/dev/hdal on / type ext2 (ro)
/dev hdal on /dev/.static/dev type ext2 (ro)
tmpfs on /dev shm type tmpfs (rw, nosuid, nodev)
devpts on /dev/pts type devpts (rw, nosuid, noexec)
none on /temp type tmpfs (rw)
/dev/mtdblock0 on /home type jffs2 (rw)
Moxa:~# mount -0 remount, rw /dev/hda1 /
Moxa:~# mount
rootfs on / type rootfs (rw)
none on / sys type sysfs (rw)
none on / proc type proc (rw)
udev on /dev type tmpfs (rw)
/dev/hda1 on / type ext2 (rw)
/dev/hda1 on /dev/.static/dev type ext2 (rw)
tmpfs on /dev/shm type tmpfs (rw,nosuid,nodev)
devpts on /dev/pts type devpts (rw,nosuid,noexec)
none on /tmp type tmpfs (rw)
/dev/mtdblock0 on /home type jffs2 (rw)
Moxa:~#
```

2. edit /boot/grub/menu.lst.

Change the device name of DOM, from root=/dev/hda => root=/dev/sdb, and then save the file.

title root kernel initrd savedefault	Debian GNU/Linux, kernel 2.6.18-5-686 (hd0,0) /boot/vmlinuz-2.6.18-5-686 root=/dev/sdb1 ro /boot/initrd.img-2.6.18-5-686
title root kernel initrd savedefault	Debian GNU/Linux, kernel 2.6.18-5-686 (single-user mode) (hd0,0) /boot/vmlinuz-2.6.18-5-686 root=/dev/sdb1 ro single /boot/initrd.img-2.6.18-5-686

3. Edit /etc/fstab file and change the selected hard disk for system bootup.

# /etc/fstab: static file system information. #							
# <file system<="" td=""><td>> <mount> point</mount></td><td>> <type></type></td><td><options></options></td><td><dump></dump></td><td><pass></pass></td><td></td></file>	> <mount> point</mount>	> <type></type>	<options></options>	<dump></dump>	<pass></pass>		
Proc	/proc	proc	defaults	0	0		
/dev/sdb1		ext2	ro,defaults,	errors=r	emount-ro	0 1	
# Mount the CF	,/dev/hdb1, on	/mnt. You	should edit	this line			
#/dev/hdb1	/mnt	ext3	defaults,err	rors=remo	unt-ro O	1	
none	/tmp	tmpfs	defaults	0	1		
/dev/hda2	/home	ext2	defaults	0	2		
/dev/hdc	/media/cdrom0	udf,iso96	60 user,noaut	20	0	0	
#/dev/fd0	/media/floppy0	auto	rw,user,naut	0 0	0		

- 4. Shut down the computer.
- 5. Remove the top cover of the DA-681, and then add the hard drive into the computer.
- 6. Reboot the computer to finish.
- 7. If you would like to uninstall the SATA hard drive, simply reverse the above procedures.

Inserting a USB Storage Device into the Computer

Since mounting USB storage devices manually can be difficult, a program named **usbmount** to mount the USB drivers automatically. **usbmount** is a small application that relies on **udev** to mount USB storage devices automatically at certain mount points. The USB storage devices will be mounted on /media/usb0, /media/usb1, etc.

```
Moxa:~# mount
```

```
/dev/hda1 on / type ext2 (rw,errors=remount-ro)
tmpfs on /lib/init/rw type tmpfs (rw,nosuid,mode=0755)
proc on /proc type proc (rw,noexec,nosuid,nodev)
sysfs on /sys type sysfs (rw,noexec,nosuid,nodev)
procbususb on /proc/bus/usb type usbfs (rw)
udev on /dev type tmpfs (rw,mode=0755)
tmpfs on /dev/shm type tmpfs (rw,nosuid,nodev)
devpts on /dev/pts type devpts
(rw,noexec,nosuid,gid=5,mode=620)
/dev/hdb2 on /home type ext2 (rw)
nfsd on /proc/fs/nfsd type nfsd (rw)
rpc_pipefs on /var/lib/nfs/rpc_pipefs type rpc_pipefs (rw)
/dev/sdal on /media/usb0 type vfat
(rw,noexec,nodev,sync,noatime,gid=25,dmask=0007,fmask=0117)
/dev/sdb1 on /media/usb1 type vfat
(rw,noexec,nodev,sync,noatime,gid=25,dmask=0007,fmask=0117)
Moxa:~#
```

ATTENTION

Remember to type the command **# sync** before you disconnect the USB storage device. If you do not issue the command, you may lose data.

ATTENTION

Remember to exit the **/media/usb0 or /media/usb1** directory when you disconnect the USB storage device. If you stay in **/media/usb0** or **/media/usb1**, the automatic un-mount process will fail. If that happens, type **# umount /media/usb0** to un-mount the USB device manually.

Inserting a CompactFlash Card into the Computer

The CompactFlash card is treated as a local disk drive in the DA-681-LX computer. It is identified as a block device at /**dev/hdb**. You can add one line to /**etc/fstab** to force the CompactFlash card to mount automatically at boot time.

ATTENTION

The DA-681 Series Embedded Computer does not support the CompactFlash hot swap function. You must remove the power source first before inserting or removing the CompactFlash card. If you do not shut down the power source, you could damage your CompactFlash card.

Moxa:~# mount -o remount,rw /dev/hdal / Moxa:~# vi /etc/fstab # /etc/fstab: static file system information. #							
# <file system<="" td=""><td>n> <mount point=""></mount></td><td><type> <</type></td><td>options></td><td><dump></dump></td><td><pass></pass></td><td></td><td></td></file>	n> <mount point=""></mount>	<type> <</type>	options>	<dump></dump>	<pass></pass>		
Proc	/proc	proc	defaults	0	0		
/dev/hda1		ext2	ro,default	s,error	s=remour	nt-ro O	1
none	/tmp	tmpfs	defaults	0	1		
/dev/hda2	/home	ext2	defaults	0	2		
/dev/hdc	/media/cdrom0	udf,iso90	660 user,noa	uto O		0	
#/dev/fd0	/media/floppy0	auto	rw,user,nc	oauto O	0		
Moxa:~#							
Moxa:~# umount	: /						
Moxa:~#							

Checking the Linux Version

The program **uname**, which stands for "Unix Name" and is part of the Unix operating system, prints the name, version, and other details about the operating system running on the computer. Use the **-a** option to generate a response similar to the one shown below:

```
Moxa:~# uname -a
Linux DA680 2.6.18-5-686 #1 SMP Mon Dec 24 16:41:07 UTC 2007
i686 GNU/Linux
Moxa:~#
```

APT—Installing and Removing Packages

APT is the Debian tool used to install and remove packages. Before installing a package, you need to configure the apt source file, **/etc/apt/sources.list**, which is located in the read-only partition.

1. Mount the root file system with write permission.

Moxa:~# mount -o remount,rw /dev/hda1 /

2. Next, configure the /etc/apt/sources.list using vi editor.

```
Moxa:~# vi /etc/apt/sources.list
#deb cdrom:[Debian GNU/Linux 4.0 r2 _Etch_ - Official i386
NETINST Binary-1 20080103-00:44]/ etch contrib main
deb http://ftp.debian.org/debian/ etch main
deb-src http://ftp.debian.org/debian/ etch main
deb http://security.debian.org/ etch/updates main contrib
deb-src http://security.debian.org/ etch/updates main contrib
Moxa:~#
```

3. Update the source list after you configure it.

Moxa:~# apt-get update Moxa:~#

4. Once you indicate which package you want to install (openswan, for example), type:

```
Moxa:~# apt-get install openswan
Moxa:~#
```

5. Use one of the following commands to remove a package: (a) For a simple package removal:

```
Moxa:~# apt-get remove openswan Moxa:~#
```

(b) For a complete package removal:

6. If the installation is complete, remember to umount the root directory back to read-only mode.

```
Moxa:~# umount /
Moxa:~#
```

ATTENTION

The APT cache space /etc/cache/apt is located in tmpfs. If you need to install a huge package, link /etc/cache/apt to USB mass storage or mount it to an NFS space to generate more free space. Use df –h to check how much free space is available on tmpfs.

Moxa:~# df -h				
Filesystem	Size	Used	Avail	Use% Mounted on
rootfs	790M	219M	531M	30% /
udev	10M	44K	10M	1% /dev
/dev/hdb1	790M	219M	531M	30% /
/dev/hdb1	790M	219M	531M	30% /dev/.static/dev
tmpfs	248M	0	248M	0% /dev/shm
none	248M	13M	236M	6% /tmp
/dev/mtdblock0	161M	25M	136M	16% /home
Moxa:~#				

ATTENTION

You can free up the cache space with the command # apt-get clean

WDT (Watchdog Timer)

1. Introduction.

The WDT works like a hardware timing device that triggers a system reboot whenever necessary. You can enable it or disable it. When users enable WDT but the application does not acknowledge it, the system will reboot. You can set the ack time from a minimum of 1 sec to a maximum of 60 seconds.

2. How the WDT works.

The Watchdog is enabled when the system boots up. The kernel will auto ack it. The user application can also enable ack. When users do not ack, it will let the system reboot.

Kernel boot

....

User application running and enable user ack

....

•••

3. The user IO control commands.

The user application can program the watchdog via below IO control commands.

// Enable the user mode watchdog driver

#define IOCTL_SWATCHDOG_ENABLE 1

// Disable the user mode watchdog driver

#define IOCTL_SWATCHDOG_DISABLE 2

// Get the driver mode and timeout information

#define IOCTL_SWATCHDOG_GET 3

// Acknowledge the user mode watchdog driver

#define IOCTL_SWATCHDOG_ACK 4

User application can programming the watchdog like this.

main() { ... swtd_fd=open("/dev/swtd", O_RDWR) ... time=4000; //4000 ms ioctl(swtd_fd, IOCTL_SWATCHDOG_ENABLE, &time); ... while(1) {

ioctl(swtd_fd, IOCTL_SWATCHDOG_ACK, NULL);
...
}
close(swtd_fd);

For convenient programming, we re-package these IO control commands in a convenient API in libswtd.c like this.

int swtd_open(void)

Description

•••

Open the file handle to control the sWatchDog. If you want to do something you must first to this. And keep the file handle to do other.

Input

}

None

Output

The return value is file handle. If has some error, it will return < 0 value.

You can get error from errno().

int swtd_enable(int fd, unsigned long time)

Description

Enable application sWatchDog. And you must do ack after this process.

Input

int fd - the file handle, from the swtd_open() return value.

unsigned long time - The time you wish to ack sWatchDog periodically. You must ack the sWatchDog before timeout. If you do not ack, the system will be reboot automatically. The minimal time is 50 msec, the maximum time is 60 seconds. The time unit is msec.

Output

OK will be zero. The other has some error, to get the error code from errno().

int swtd_disable(int fd)

Description:

Disable the application to ack sWatchDog. And the kernel will be auto ack it. User does not to do it at periodic.

Input:

int fd - the file handle from swtd_open() return value.

Output:

OK will be zero. The other has some error, to get error code from errno.

int swtd_get(int fd, int *mode, unsigned long *time)

Description:

Get current setting values.

mode -

1 for user application enable sWatchDog: need to do ack.

0 for user application disable sWatchdog: does not need to do ack.

time – The time period to ack sWatchDog.

Input:

int fd - the file handle from swtd_open() return value.

int *mode - the function will be return the status enable or disable user application need to do ack.

unsigned long *time – the function will return the current time period.

Output:

OK will be zero.

The other has some error, to get error code from errno().

int swtd_ack(int fd)

Description:

Acknowledge sWatchDog. When the user application enable sWatchDog. It need to call this function periodically with user predefined time in the application program.

Input:

int fd - the file handle from swtd_open() return value.

Output:

OK will be zero.

The other has some error, to get error code from errno().

int swtd_close(int fd)

Description:

Close the file handle.

Input:

int fd - the file handle from swtd_open() return value.

Output:

OK will be zero.

The other has some error, to get error code from errno().

4. Special Note.

When you "kill the application with -9" or "kill without option" or "Ctrl+c" the kernel will change to auto ack the sWatchDog.

When your application enables the sWatchDog and does not ack, your application may have a logical error, or your application has made a core dump. The kernel will not change to auto ack. This can cause a serious problem, causing your system to reboot again and again.

5. User application example.

Example 1:

```
#include<stdio.h>
#include<stdlib.h>
#include<string.h>
int main(int argc, char *argv[])
{
        int fd;
        fd = swtd_open();
        if ( fd < 0 ) {
             printf("Open sWatchDog device fail !\n");
             exit(1);
        }
        swtd_enable(fd, 5000); // enable it and set it 5 seconds
        while ( 1 ) {
             // do user application want to do
             .....
             swtd_ack(fd);
             ···· •
        }
        swtd_close(fd);
        exit(0);
}
/*
* The convenient watchdog API --- libswtd.c
*/
#include<stdio.h>
#include<stdlib.h>
#include<fcntl.h>
```

```
// following for sWatchDog implement
#define IOCTL_SWATCHDOG_ENABLE
#define IOCTL_SWATCHDOG_DISABLE
                                 2
#define IOCTL_SWATCHDOG_GET 3
#define IOCTL_SWATCHDOG_ACK 4
intswtd_open(void)
{
   return open("/dev/swtd", O_RDWR);
}
intswtd_enable(int fd, unsigned long time)
{
   return ioctl(fd, IOCTL_SWATCHDOG_ENABLE, &time);
}
intswtd_disable(int fd)
{
   return ioctl(fd, IOCTL_SWATCHDOG_DISABLE, NULL);
}
intswtd_get(int fd, int *mode, unsigned long *time)
{
   struct {
        int
                  mode;
        unsigned long time;
   } nowset;
   int
                  ret:
   ret = ioctl(fd, IOCTL_SWATCHDOG_GET, &nowset);
   *mode = nowset.mode;
   *time = nowset.time;
   return ret;
}
intswtd_ack(int fd)
{
   return ioctl(fd, IOCTL_SWATCHDOG_ACK, NULL);
}
intswtd_close(int fd)
{
   return close(fd);
}
The makefile is shown below:
all:
        gcc xxxx.c libswtd.c -o xxxx
Example 2:
#include<stdio.h>
#include<stdlib.h>
#include<signal.h>
#include<string.h>
#include<sys/stat.h>
#include<sys/ioctl.h>
#include<sys/select.h>
#include<sys/time.h>
#include<moxadevice.h>
static void mydelay(unsigned long msec)
{
        struct timeval time;
        time.tv_sec = msec / 1000;
        time.tv_usec = (msec % 1000) * 1000;
        select(1, NULL, NULL, NULL, &time);
}
```

```
static int
             swtdfd:
static int
             stopflag=0;
static void stop_swatchdog()
{
        stopflag = 1;
}
static void do_swatchdog(void)
{
        swtd_enable(swtdfd, 500);
        while ( stopflag == 0 ) {
            mydelay(250);
             swtd_ack(swtdfd);
        }
        swtd_disable(swtdfd);
   }
intmain(int argc, char *argv[])
{
        pid_t
                       sonpid;
        signal(SIGUSR1, stop_swatchdog);
        swtdfd = swtd_open();
        if ( swtdfd < 0 ) {
             printf("Open sWatchDog device fail !\n");
             exit(1);
        }
        if ( (sonpid=fork()) == 0 )
             do_swatchdog();
        // do user application main function
        ... . .
        .....
        // end user application
        kill(sonpid, SIGUSR1);
        swtd_close(swtdfd);
        exit(1);
}
/*
* The convenient watchdog API --- libswtd.c
*/
#include<stdio.h>
#include<stdlib.h>
#include<fcntl.h>
// following for sWatchDog implement
#define IOCTL_SWATCHDOG_ENABLE
                                 1
#define IOCTL_SWATCHDOG_DISABLE 2
#define IOCTL_SWATCHDOG_GET 3
#define IOCTL_SWATCHDOG_ACK 4
intswtd_open(void)
{
   return open("/dev/swtd", O_RDWR);
}
intswtd_enable(int fd, unsigned long time)
{
   return ioctl(fd, IOCTL_SWATCHDOG_ENABLE, &time);
}
intswtd_disable(int fd)
{
   return ioctl(fd, IOCTL_SWATCHDOG_DISABLE, NULL);
}
intswtd_get(int fd, int *mode, unsigned long *time)
```

DA-681 Series Linux User's Manual

```
{
   struct {
       int
                 mode;
       unsigned long time;
   } nowset;
  int
                 ret;
  ret = ioctl(fd, IOCTL_SWATCHDOG_GET, &nowset);
   *mode = nowset.mode;
   *time = nowset.time;
  return ret;
}
intswtd_ack(int fd)
{
   return ioctl(fd, IOCTL_SWATCHDOG_ACK, NULL);
}
intswtd_close(int fd)
{
   return close(fd);
}
The makefile is shown below:
all:
       gcc xxxx.c libswtd.c -o xxxx
```

Managing Communications

The DA-681-LX ready-to-run embedded computer is a network-centric platform designed to serve as a front-end for data acquisition and industrial control applications. This chapter describes how to configure the various communication functions supported by the Linux operating system.

This chapter covers the following topics:

- **Changing the Network Settings**
 - > Changing the "interfaces" Configuration File
 - Adjusting IP Addresses with "ifconfig"
- **Telnet Server**
- **DNS** Client
- □ Apache Web Server
 - Default Homepage
 - Saving Web Pages to a USB Storage Device

□ IPTABLES

- ➢ IPTABLES Hierarchy
- IPTABLES Modules
- Observe and Erase Chain Rules
- Define Policy for Chain Rules
- Append or Delete Rules

□ NAT (Network Address Translation)

- NAT Example
- Enabling NAT at Bootup

PPP (Point to Point Protocol)

- Connecting to a PPP Server over a Simple Dial-up Connection
- Connecting to a PPP Server over a Hard-wired Link
- Checking the Connection
- > Setting up a Machine for Incoming PPP Connections
- **PPPoE**
- □ NFS (Network File System) Client
- □ SNMP (Simple Network Management Protocol)

OpenVPN

- > Ethernet Bridging for Private Networks on Different Subnets
- > Ethernet Bridging for Private Networks on the Same Subnet
- Routed IP

Changing the Network Settings

The DA-681-LX computer has 6 10/100 Mbps Ethernet ports named LAN1 to LAN6. The default IP addresses and netmasks of the network interfaces are as follows:

	Default IP Address	Netmask
LAN 1	192.168.3.127	255.255.255.0
LAN 2	192.168.4.127	255.255.255.0
LAN 3	192.168.5.127	255.255.255.0
LAN 4	192.168.6.127	255.255.255.0
LAN 5	192.168.7.127	255.255.255.0
LAN 6	192.168.8.127	255.255.255.0

These network settings can be modified by changing the **interfaces** configuration file, or they can be adjusted temporarily with the **ifconfig** command.

Changing the "interfaces" Configuration File

1. Type **cd /etc/network** to change directory.

Moxa:~# cd /etc/network

2. Type **vi interfaces** to edit the network configuration file with **vi** editor. You can configure the DA-681-LX's Ethernet ports for static or dynamic (DHCP) IP addresses.

Moxa:/etc/network# vi interfaces

Static IP Address

As shown in the example shown below, the default static IP addresses can be modified.

```
# The loopback network interface
auto lo eth0 eth1 eth2 eth3 eth4 eth5
iface lo inet loopback
# The primary network interface
allow-hotplug eth0
iface eth0 inet static
      address 192.168.3.127
      netmask 255.255.255.0
      broadcast 192.168.3.255
allow-hotplug eth1
iface eth1 inet static
      address 192.168.4.127
      netmask 255.255.255.0
      broadcast 192.168.4.255
allow-hotplug eth2
iface eth2 inet static
      address 192.168.5.127
      netmask 255.255.255.0
      broadcast 192.168.5.255
```

Dynamic IP Address using DHCP

To configure one or both LAN ports to request an IP address dynamically, replace **static** with **dhcp** and then delete the rest of the lines.

After modifying the boot settings of the LAN interface, issue the following command to activate the LAN settings immediately.

/etc/init.d/networking restart

Moxa:~# /etc/init.d/networking restart

Adjusting IP Addresses with "ifconfig"

IP settings can be adjusted during run-time, but the new settings will not be saved to disk without modifying the file /etc/network/interfaces. For example, type the command #ifconfig eth1 **192.168.1.1** to change the IP address of LAN1 to 192.168.1.1.

```
Moxa:~# ifconfig eth1 192.168.1.1
Moxa:~#
```

Telnet Server

In addition to supporting Telnet client/server, the DA-681-LX also supports SSH and sftp client/server. To enable or disable the Telnet server, you need to edit the file /etc/inetd.conf.

1. Mount the root file system with write permission.

Moxa:~# mount -o remount,rw /dev/hda1 /

2. Type **# cd /etc** to change the directory.

Moxa:~# cd /etc

3. Type **# vi inetd.conf** to edit the configuration file.

Moxa:/etc# vi inetd.conf

Enabling the Telnet Server

The following example shows the default content of the file **/etc/inetd.conf**. The default is to "enable the Telnet server:"

discard dgram udp wait root /bin/discard discard stream tcp nowait root /bin/discard telnet stream tcp nowait root /bin/telnetd

Disabling the Telnet Server

Disable the daemon by typing "#" in front of the first character of the row to comment out the line. For example, to disable the **Telnet** server, use the following commands:

After you finish writing or modifying the code, remember to execute "umount /" to change the root directory back to Read-only mode.

Moxa:~# umount /

FTP Server

Refer to the following commands to enable or disable the FTP Server service.

Enabling the FTP Server

Use the following command to enable the FTP server.

Moxa:~# /etc/init.d/proftpd start

Starting ftp server: proftpd.

Use the following command to confirm if the FTP has been started.

Moxa:~#ps aux|grep proftp

If profptd string has appeared, the FTP server has been started.

Disabling the FTP Server

Use the following command to disable the FTP server.

Moxa:~# /etc/init.d/proftpd stop

Stopping ftp server: proftpd.

To confirm if FTP has been disabled, use the following command.

Moxa:~# ps auxgrep proftp

If profptd string has not appeared, the FTP server has been disabled.

DNS Client

The DA-681-LX supports DNS client (but not DNS server). To set up DNS client, you need to edit three configuration files: **/etc/hostname**, **/etc/resolv.conf**, and **/etc/nsswitch.conf**.

/etc/hostname

1. Mount the root file system with write permission.

Moxa:~# mount -o remount,rw /dev/hda1 /

2. Edit /etc/hostname:

3. After you finish writing or modifying the code, remember to execute "umount /" to change the root directory back to Read-only mode.

Moxa:~# umount /

4. Re-configure the hostname.

Moxa:~# /etc/init.d/hostname.sh start

5. Check the new hostname.

Moxa:~# hostname

/etc/resolv.conf

This is the most important file that you need to edit when using DNS. For example, before you using **# ntpdate time.nist.goc** to update the system time, you will need to add the DNS server address to the file. Ask your network administrator which DNS server address you should use. The DNS server's IP address is specified with the **nameserver** command. For example, add the following line to /etc/resolv.conf (assuming the DNS server's IP address is 168.95.1.1):

nameserver 168.95.1.1

```
Moxa:/etc# cat resolv.conf
#
# resolv.conf This file is the resolver configuration file
# See resolver(5).
#
# #nameserver 192.168.1.16
nameserver 168.95.1.1
nameserver 140.115.1.31
nameserver 140.115.236.10
Moxa:/etc#
```

/etc/nsswitch.conf

This file defines the sequence of files, **/etc/hosts** or **/etc/resolv.conf**, to be read to resolve the IP address.

The **hosts** line in **/etc/nsswitch.conf** means use **/etc/host** first and DNS service to resolve the address.

<pre># /etc/nsswitch.conf # # Example configuration of GNU Name Service Switch functionality. # If you have the `glibc-doc-reference' and `info' packages installed, try: # `info libc "Name Service Switch"' for information about this file.</pre>			
passwd:	compat		
group:	compat		
shadow:	compat		
hosts:	files dns		
networks:	files		
protocols:	db files		
services:	db files		
ethers:	db files		
rpc:	db files		
netgroup:	nis		

Apache Web Server

Default Homepage

The Apache web server's main configuration file is /etc/apache2/sites-available/default, with the default homepage located at /var/www/apache2-default/index.html.

Save your own homepage to the following directory:

/var/www/apache2-default

Save your CGI page to the following directory:

/var/www/apache2-default/cgi-bin/

Add a main page file under **cgi-bin** directory. For example, you may add a file called **index.cgi** at /**var/www/apache2-default/cgi-bin**/.

#!/bin/sh

#/var/www/apache2-default/cgi-bin/index.cgi

disable filename globbing

set -f

echo "Content-type: text/plain; charset=iso-8859-1"

echo

echo CGI/1.0 test script report:

echo

echo argc is \$#. argv is "\$*".

echo

echo SERVER_SOFTWARE = \$SERVER_SOFTWARE echo SERVER_NAME = \$SERVER_NAME echo GATEWAY_INTERFACE = \$GATEWAY_INTERFACE echo SERVER PROTOCOL = \$SERVER PROTOCOL echo SERVER_PORT = \$SERVER_PORT echo REQUEST_METHOD = \$REQUEST_METHOD echo HTTP_ACCEPT = "\$HTTP_ACCEPT" echo PATH_INFO = "\$PATH_INFO" echo PATH_TRANSLATED = "\$PATH_TRANSLATED" echo SCRIPT_NAME = "\$SCRIPT_NAME" echo QUERY_STRING = "\$QUERY_STRING" echo REMOTE HOST = \$REMOTE HOST echo REMOTE_ADDR = \$REMOTE_ADDR echo REMOTE_USER = \$REMOTE_USER echo AUTH_TYPE = \$AUTH_TYPE echo CONTENT_TYPE = \$CONTENT_TYPE echo CONTENT_LENGTH = \$CONTENT_LENGTH

Before you modify the homepage, use a browser (such as Microsoft Internet Explore or Mozilla Firefox) from your PC to test if the Apache web server is working. Type the LAN1 IP address in the browser's address box to open the homepage. For example, if the default IP address 192.168.3.127 is still active, type:

http://192.168.3.127/

To test the default CGI page, type:

http://192.168.3.127/cgi-bin/index.cgi

ATTENTION

When you develop your own CGI application, make sure your CGI file is executable.

Saving Web Pages to a USB Storage Device

Some applications may have web pages that take up a lot of memory space. This section describes how to save web pages to the USB mass storage device, and then configure the Apache web server's DocumentRoot to open these pages. The files used in this example can be downloaded from Moxa's website.

- Prepare the web pages and then save the pages to the USB storage device. Click on the following link to download the web page test suite: http://www.w3.org/MarkUp/Test/HTML401.zip.
- 2. Uncompress the zip file to your desktop PC, and then use FTP to transfer it to the DA-681-LX's /media/usb0 directory.
- 3. Mount the root file system with write permission.

Moxa:~# mount -o remount,rw /dev/hda1 /

4. Type # vi /etc/apache2/sites-available/default to edit the configuration file.

Moxa:/etc# vi /etc/apache2/sites-available/default

5. Change the DocumentRoot directory to the USB storage directory /media/usb0/www.

```
<VirtualHost *:80>
. . .
      DocumentRoot /media/usb0/www
      <Directory />
             Options FollowSymLinks
             AllowOverride None
       </Directory>
. . .
      ScriptAlias /cgi-bin/ /media/usb0/www/cgi-bin/
      <Directory "/media/usb0/www/cgi-bin/">
             AllowOverride None
             Options ExecCGI -MultiViews +SymLinksIfOwnerMatch
             Order allow, deny
             Allow from all
       </Directory>
</VirtualHost>
<VirtualHost *:443>
. . .
. . .
      DocumentRoot /media/usb0/www
      <Directory />
             Options FollowSymLinks
             AllowOverride None
      </Directory>
. . .
. . .
      ScriptAlias /cgi-bin/ /media/usb0/www/cgi-bin/
      <Directory "/media/usb0/wwwz/cgi-bin/">
             AllowOverride None
             Options ExecCGI -MultiViews +SymLinksIfOwnerMatch
             Order allow, deny
             Allow from all
      </Directory>
</VirtualHost>
```

6. Use the following commands to restart the Apache web server:

#cd /etc/init.d #./apache2 restart

- 7. Open your browser and connect to the DA-681-LX by typing the current LAN1 IP address in the browser's address box.
- 8. After finishing modification or writing, remember to execute "umount /" to change the root directory back to Read-only mode.

Moxa:~# umount /

9. Re-start the apache server.

Moxa:~# /etc/init.d/apache2 restart

ATTENTION

Visit the Apache website at <u>http://httpd.apache.org/docs/</u> for more information about setting up Apache servers.

IPTABLES

IPTABLES is an administrative tool for setting up, maintaining, and inspecting the Linux kernel's IP packet filter rule tables. Several different tables are defined, with each table containing built-in chains and user-defined chains.

Each chain is a list of rules that apply to a certain type of packet. Each rule specifies what to do with a matching packet. A rule (such as a jump to a user-defined chain in the same table) is called a **target**.

The DA-681-LX supports three types of IPTABLES: Filter tables, NAT tables, and Mangle tables.

Filter Table—includes three chains:

INPUT chain OUTPUT chain FORWARD chain

NAT Table—includes three chains:

PREROUTING chain-transfers the destination IP address (DNAT).

POSTROUTING chain—works after the routing process and before the Ethernet device process to transfer the source IP address (SNAT).

OUTPUT chain-produces local packets.

Sub-tables

Source NAT (SNAT)—changes the first source packet IP address.

Destination NAT (DNAT)-changes the first destination packet IP address.

MASQUERADE—a special form for SNAT. If one host can connect to the Internet, then the other computers that connect to this host can connect to the Internet when the computer does not have an actual IP address.

REDIRECT—a special form of DNAT that re-sends packets to a local host independent of the destination IP address.

Mangle Table—includes two chains

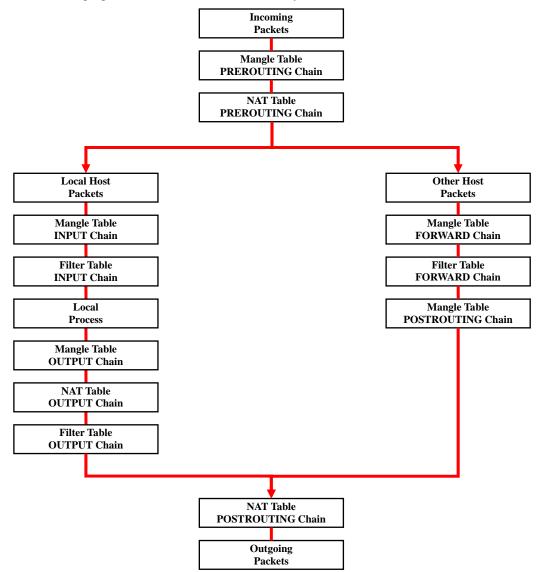

PREROUTING chain-pre-processes packets before the routing process.

OUTPUT chain—processes packets after the routing process.

Mangle tables can have one of three extensions-TTL, MARK, TOS.

IPTABLES Hierarchy

The following figure shows the IPTABLES hierarchy.

IPTABLES Modules

The DA-681-LX supports the following sub-modules. Be sure to use the module that matches your application.

arptable_filter.ko	arp_tables.ko	arpt_mangle.ko	ip_conntrack_amand a.ko
ip_conntrack_ftp.ko	ip_conntrack_h323.k o	ip_conntrack_irc.ko	ip_conntrack.ko
ip_conntrack_netbios _ns.ko	ip_conntrack_netlink. ko	ip_conntrack_pptp.ko	ip_conntrack_proto_s ctp.ko
ip_conntrack_sip.ko	ip_conntrack_tftp.ko	ip_nat_amanda.ko	ip_nat_ftp.ko
ip_nat_h323.ko	ip_nat_irc.ko	ip_nat.ko	ip_nat_pptp.ko
ip_nat_sip.ko	ip_nat_snmp_basic.k o	ip_nat_tftp.ko	ip_queue.ko
iptable_filter.ko	iptable_mangle.ko	iptable_nat.ko	iptable_raw.ko
ip_tables.ko	ipt_addrtype.ko	ipt_ah.ko	ipt_CLUSTERIP.ko
ipt_dscp.ko	ipt_DSCP.ko	ipt_ecn.ko	ipt_ECN.ko
ipt_hashlimit.ko	ipt_iprange.ko	ipt_LOG.ko	ipt_MASQUERADE.k o
ipt_NETMAP.ko	ipt_owner.ko	ipt_recent.ko	ipt_REDIRECT.ko
ipt_REJECT.ko	ipt_SAME.ko	ipt_TCPMSS.ko	ipt_tos.ko
ipt_TOS.ko	ipt_ttl.ko	ipt_TTL.ko	ipt_ULOG.ko

The basic syntax to enable and load an IPTABLES module is as follows:

lsmod

modprobe ip_tables
modprobe iptable_filter

Use **lsmod** to check if the **ip_tables** module has already been loaded in the DA-681-LX. Use **modprobe** to insert and enable the module.

Use the following command to load the modules (iptable_filter, iptable_mangle, iptable_nat):

modprobe iptable_filter

Use iptables, iptables-restore, iptables-save to maintain the database.

ATTENTION

IPTABLES plays the role of packet filtering or NAT. Be careful when setting up the IPTABLES rules. If the rules are not correct, remote hosts that connect via a LAN or PPP may be denied. We recommend using the VGA console to set up the IPTABLES. Click on the following links for more information about IPTABLES.

http://www.linuxguruz.com/iptables/ http://www.netfilter.org/documentation/HOWTO//packet-filtering-HOWTO.html

Since the IPTABLES command is very complex, to illustrate the IPTABLES syntax we have divided our discussion of the various rules into three categories: Observe and erase chain rules, Define policy rules, and Append or delete rules.

Observe and Erase Chain Rules

Usage:

iptables [-t tables] [-L] [-n]

-t tables: Table to manipulate (default: 'filter'); example: nat or filter.

-L [chain]: List List all rules in selected chains. If no chain is selected, all chains are listed. -n: Numeric output of addresses and ports.

iptables [-t tables] [-FXZ]

- -F: Flush the selected chain (all the chains in the table if none is listed).
- -X: Delete the specified user-defined chain.
- -Z: Set the packet and byte counters in all chains to zero.

Examples:

iptables -L -n

In this example, since we do not use the -t parameter, the system uses the default "filter" table. Three chains are included: INPUT, OUTPUT, and FORWARD. INPUT chains are accepted automatically, and all connections are accepted without being filtered.

iptables -F
iptables -X
iptables -Z

Define Policy for Chain Rules

Usage:

iptables [-t tables] [-P] [INPUT, OUTPUT, FORWARD, PREROUTING, OUTPUT, POSTROUTING] [ACCEPT, DROP]

-P: Set the policy for the chain to the given target. INPUT: For packets coming into the DA-681-I-LX. OUTPUT: For locally-generated packets. FORWARD: For packets routed out through the DA-681-I-LX. PREROUTING: To alter packets as soon as they come in. POSTROUTING: To alter packets as they are about to be sent out.

Examples:

#iptables -P INPUT DROP
#iptables -P OUTPUT ACCEPT
#iptables -P FORWARD ACCEPT
#iptables -t nat -P PREROUTING ACCEPT
#iptables -t nat -P OUTPUT ACCEPT
#iptables -t nat -P POSTROUTING ACCEPT

In this example, the policy accepts outgoing packets and denies incoming packets.

Append or Delete Rules

Usage:

iptables [-t table] [-AI] [INPUT, OUTPUT, FORWARD] [-io interface] [-p tcp, udp, icmp, all] [-s IP/network] [--sport ports] [-d IP/network] [--dport ports] –j [ACCEPT. DROP]

-A: Append one or more rules to the end of the selected chain.

-I: Insert one or more rules in the selected chain as the given rule number.

-i: Name of an interface via which a packet is going to be received.

-o: Name of an interface via which a packet is going to be sent.

-p: The protocol of the rule or of the packet to check.

-s: Source address (network name, host name, network IP address, or plain IP address).

--sport: Source port number.

-d: Destination address.

--dport: Destination port number.

-j: Jump target. Specifies the target of the rules; i.e., how to handle matched packets.

For example, ACCEPT the packet, DROP the packet, or LOG the packet.

Examples:

Example 1: Accept all packets from the lo interface.

iptables -A INPUT -i lo -j ACCEPT

Example 2: Accept TCP packets from 192.168.0.1.

iptables -A INPUT -i eth0 -p tcp -s 192.168.0.1 -j ACCEPT

Example 3: Accept TCP packets from Class C network 192.168.1.0/24.

iptables - A INPUT - i eth0 - p tcp - s 192.168.1.0/24 - j ACCEPT

Example 4: Drop TCP packets from 192.168.1.25.

iptables -A INPUT -i eth0 -p tcp -s 192.168.1.25 -j DROP

Example 5: Drop TCP packets addressed for port 21.

iptables -A INPUT -i eth0 -p tcp --dport 21 -j DROP

Example 6: Accept TCP packets from 192.168.0.24 to DA-681-I-LX's port 137, 138, 139

iptables -A INPUT -i eth0 -p tcp -s 192.168.0.24 -- dport 137:139 -j ACCEPT

Example 7: Log TCP packets that visit DA-681-I-LX's port 25.

iptables -A INPUT -i eth0 -p tcp --dport 25 -j LOG

Example 8: Drop all packets from MAC address 01:02:03:04:05:06.

iptables -A INPUT -i eth0 -p all -m mac --mac-source 01:02:03:04:05:06 -j DROP

ATTENTION

In Example 8, remember to issue the command **# modprobe ipt_mac** first to load the module **ipt_mac**.

NAT (Network Address Translation)

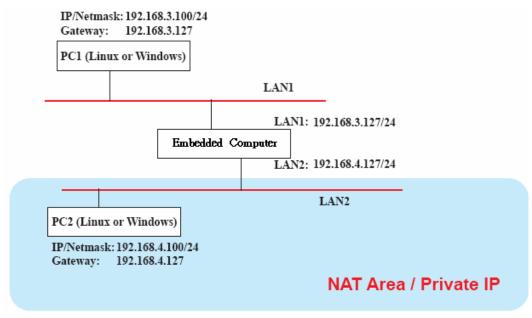

The NAT (Network Address Translation) protocol translates IP addresses used on one network into IP addresses used on a connecting network. One network is designated the inside network and the other is the outside network. Typically, the DA-681-LX connects several devices on a network and maps local inside network addresses to one or more global outside IP addresses, and un-maps the global IP addresses on incoming packets back into local IP addresses.

ATTENTION

Click on the following links for more information about NAT. http://www.netfilter.org/documentation/HOWTO//packet-filtering-HOWTO.html

NAT Example

The IP address of all packets leaving LAN1 are changed to **192.168.3.127** (you will need to load the module **ipt_MASQUERADE**):

#ehco 1 > /proc/sys/net/ipv4/ip_forward #modprobe ipt_MASQUERADE #iptables -t nat -A POSTROUTING -o eth0 -j MASQUERADE

Enabling NAT at Bootup

In most real world situations, you will want to use a simple shell script to enable NAT when the DA-681-LX boots up. The following script is an example.

#!/bin/bash
If you put this shell script in the /home/nat.sh
Remember to chmod 744 /home/nat.sh
Edit the rc.local file to make this shell startup automatically.
vi /etc/rc.local
Add a line in the end of rc.local /home/nat.sh

EXIF= "eth0" #This is an external interface for setting up a valid IP address. EXNET= "192.168.4.0/24" #This is an internal network address.

Step 1. Insert modules.

Here 2> /dev/null means the standard error messages will be dump to null device.

modprobe ip_tables 2> /dev/null
modprobe ip_nat_ftp 2> /dev/null
modprobe ip_nat_irc 2> /dev/null
modprobe ip_conntrack 2> /dev/null
modprobe ip_conntrack_ftp 2> /dev/null
modprobe ip_conntrack_irc 2> /dev/null

Step 2. Define variables, enable routing and erase default rules.

PATH=/bin:/sbin:/usr/bin:/usr/local/bin:/usr/local/sbin export PATH echo "1" > /proc/sys/net/ipv4/ip_forward /sbin/iptables -F /sbin/iptables -X /sbin/iptables -Z /sbin/iptables -Z -t nat /sbin/iptables -Z -t nat /sbin/iptables -Z -t nat /sbin/iptables -P INPUT ACCEPT /sbin/iptables -P OUTPUT ACCEPT /sbin/iptables -P FORWARD ACCEPT /sbin/iptables -t nat -P PREROUTING ACCEPT /sbin/iptables -t nat -P POSTROUTING ACCEPT /sbin/iptables -t nat -P OUTPUT ACCEPT

Step 3. Enable IP masquerade.

PPP (Point to Point Protocol)

PPP (Point to Point Protocol) is used to run IP (Internet Protocol) and other network protocols over a serial link. PPP can be used for direct serial connections (using a null-modem cable) over a Telnet link, and links established using a modem over a telephone line.

Modem/PPP access is almost identical to connecting directly to a network through the DA-681-LX's Ethernet port. Since PPP is a peer-to-peer system, the DA-681-LX can also use PPP to link two networks (or a local network to the Internet) to create a Wide Area Network (WAN).

ATTENTION

Click on the following links for more information about PPP.

http://tldp.org/HOWTO/PPP-HOWTO/index.html http://axion.physics.ubc.ca/ppp-linux.html

Connecting to a PPP Server over a Simple Dial-up Connection

The following command is used to connect to a PPP server by modem. Use this command for old ppp servers that prompt for a login name (replace "username" with the correct name) and password (replace "password" with the correct password). Note that "debug crtscts" and "defaultroute 192.1.1.17" are optional.

#pppd connect 'chat -v "" ATDT5551212 CONNECT ""' ogin: username word: password' /dev/ttyM0 115200 debug crtscts modem defaultroute 192.1.1.17

If the PPP server does not prompt for the username and password, the command should be entered as follows. Replace "username" with the correct username and replace "password" with the correct password.

#pppd connect 'chat -v "" ATDT5551212 CONNECT "" user username password password /dev/ttyM0 115200 crtscts modem

The pppd options are described below:

connect 'chat etc'	This option gives the command to contact the PPP server. The chat program is used to dial a remote computer. The entire command is enclosed in single quotes because pppd expects a one-word argument for the connect option. The options for chat are given below:	
-v	verbose mode; log what we do to syslog	
	Double quotes—don't wait for a prompt, but instead do (note that you must include a space after the second quotation mark)	
ATDT5551212	Dial the modem, and then	
CONNECT	Wait for an answer.	
	Send a return (null text followed by the usual return)	
ogin: username word: password Log in with username and password.		
Refer to the chat man page, chat.8, for more information about the chat utility.		
/dev/	Specify the callout serial port.	
115200	The baud rate.	

debug	Log status in syslog.
crtscts	Use hardware flow control between computer and modem (at 115200 this is a must).
modem	Indicates that this is a modem device; pppd will hang up the phone before and after making the call.
defaultroute	Once the PPP link is established, make it the default route; if you have a PPP link to the Internet, this is probably what you want.
192.1.1.17	This is a degenerate case of a general option of the form x.x.x.y.y.y.y. Here x.x.x.x is the local IP address and y.y.y.y is the IP address of the remote end of the PPP connection. If this option is not specified, or if just one side is specified, then x.x.x.x defaults to the IP address associated with the local machine's hostname (located in /etc/hosts), and y.y.y.y is determined by the remote machine.

Connecting to a PPP Server over a Hard-wired Link

If a username and password are not required, use the following command (note that **noipdefault** is optional):

#pppd connect 'chat -v" " " " noipdefault /dev/ttyM0 19200 crtscts

If a username and password is required, use the following command (note that **noipdefault** is optional, and root is both the username and password):

#pppd connect 'chat -v""" ' user root password root noipdefault /dev/ttyM0 19200 crtscts

Checking the Connection

Once you have set up a PPP connection, there are some steps you can take to test the connection. First, type:

#/sbin/ifconfig

Depending on your distribution, the command might be located elsewhere. After executing the command, you should be able to see all of the network interfaces that are UP.

ppp0 should be one of them, and you should recognize the first IP address as your own and the **P-t-P address** (point-to-point address, the address of your server). The output is similar to the following:

Link encap Local Loopback 10 inet addr 127.0.0.1 Bcast 127.255.255.255 Mask 255.0.0.0 UP LOOPBACK RUNNING MTU 2000 Metric 1 RX packets 0 errors 0 dropped 0 overrun 0 Link encap Point-to-Point Protocol ppp0 addr 192.76.32.3 P-t-P 129.67.1.165 inet Mask 255.255.255.0 UP POINTOPOINT RUNNING MTU 1500 Metric 1 RX packets 33 errors 0 dropped 0 overrun 0 TX packets 42 errors 0 dropped 0 overrun 0

Now, type:

#ping z.z.z.z

where z.z.z.z is the address of your name server. The output is similar to the following:

```
Moxa:~# ping 129.67.1.165
PING 129.67.1.165 (129.67.1.165): 56 data bytes
64 bytes from 129.67.1.165: icmp_seq=0 ttl=225 time=268 ms
64 bytes from 129.67.1.165: icmp_seq=1 ttl=225 time=247 ms
64 bytes from 129.67.1.165: icmp_seq=2 ttl=225 time=266 ms
^C
--- 129.67.1.165 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 247/260/268 ms
Moxa:~#
```

Try typing:

#netstat -nr

This should show three routes similar to the following:

Kernel routing table						
Destination	Gateway	Genmask	Flags	Metric	Ref	
Use						
iface						
129.67.1.165	0.0.0.0	255.255.255.255	UH	0	0	
6						
ppp0						
127.0.0.0	0.0.0.0	255.0.0.0	U	0	0	
0 lo						
0.0.0.0	129.67.1.165	0.0.0.0	UG	0	0	
6298						
ppp0						

If your output looks similar but does not have the "destination 0.0.0.0" line (which refers to the default route used for connections), you may have run pppd without the **defaultroute** option. At this point, you can try using Telnet, ftp, or finger, bearing in mind that you will have to use numeric IP addresses unless you have configured **/etc/resolv.conf** correctly.

Setting up a Machine for Incoming PPP Connections

Method 1: pppd dial-in with pppd commands

This first example applies to using a modem, and requiring authorization with a username and password.

#pppd /dev/ttyM0 115200 crtscts modem 192.168.16.1:192.168.16.2 login auth

You should also add the following line to the file /etc/ppp/pap-secrets:

* * (699 *

The first star (*) lets everyone login. The second star (*) lets every host connect. The pair of double quotation marks ("") indicates that the file **/etc/passwd** can be used to check the password. The last star (*) is to let any IP connect.

The following example does not check the username and password:

pppd/dev/ttyM0 115200 crtscts modem 192.168.16.1:192.168.16.2

Method 2: pppd dial-in with pppd script

Configure a dial-in script /etc/ppp/peer/dialin

```
# You usually need this if there is no PAP authentication
noauth
#auth
#login
# The chat script (be sure to edit that file, too!)
init "/usr/sbin/chat -v -f /etc/ppp/ppp-ttyM0.chat"
# Set up routing to go through this PPP link
defaultroute
# Default modem (you better replace this with /dev/ttySx!)
/dev/ttyM0
# Speed

crtscts
modem
192.168.16.1:192.168.16.2
debug
-detach
```

Configure the chat script /etc/ppp/ppp-ttyM0.chat

SAY 'Auto Answer ON\n' '' ATS0=1

Start the **pppd** dial-in service.

pppd call dialin

ATTENTION

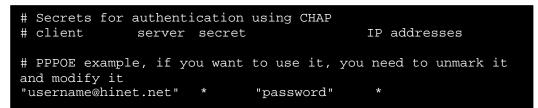

If you hope to have auto dial-in service, you can respawn the dial-in service in /etc/inittab.

```
Moxa:~# mount -o remount,rw /dev/hda1 /
Moxa:~# echo "p0:2345:respawn:pppd call dialin" >>
/etc/inittab
Moxa:~# umount /
```

PPPoE

The following procedure is for setting up PPPoE:

- 1. Connect the DA-681-LX's LAN port to an ADSL modem with a cross-over cable, HUB, or switch.
- 2. Log in to the DA-681-LX as the root user.
- 3. Edit the file /etc/ppp/chap-secrets and add the following: "username@hinet.net" * "password" *

username@hinet.net is the username obtained from the ISP to log in to the ISP account. **password** is the corresponding password for the account.

4. Edit the file /etc/ppp/pap-secrets and add the following: "username@hinet.net" * "password" *

```
# ATTENTION: The definitions here can allow users to login
without a
# password if you don't use the login option of pppd! The
mgetty Debian
# package already provides this option; make sure you don't
change that.
# INBOUND connections
 Every regular user can use PPP and has to use passwords
#
from /etc/passwd
                      11 11
      hostname
                                              *
"username@hinet.net"
                               "password"
# UserIDs that cannot use PPP at all. Check your /etc/passwd
and add any
# other accounts that should not be able to use pppd!
guest
       hostname
                      11 * 11
                      " * "
master hostname
                              _
                      " * "
       hostname
root
                       " * "
support hostname
       hostname
                      " * "
stats
# OUTBOUND connections
```

username@hinet.net is the username obtained from the ISP to log in to the ISP account. **password** is the corresponding password for the account.

5. Edit the file /etc/ppp/options and add the following line: plugin rp-pppoe

```
Note: it is not advisable to use this option
# received.
with the persist
# option without the demand option.
                                       If the active-filter
option is given,
# data packets which are rejected by the specified activity
filter also
# count as the link being idle.
#idle <n>
# Specifies how many seconds to wait before re-initiating the
link after
                   This option only has any effect if the
# it terminates.
persist or demand
# option is used.
                  The holdoff period is not applied if the
link was
# terminated because it was idle.
#holdoff <n>
# Wait for up n milliseconds after the connect script
finishes for a valid
# PPP packet from the peer. At the end of this time, or when
a valid PPP
# packet is received from the peer, pppd will commence
negotiation by
# sending its first LCP packet. The default value is 1000 (1
second).
# This wait period only applies if the connect or pty option
is used.
#connect-delay <n>
# Load the pppoe plugin
plugin rp-pppoe.so
# ---<End of File>---
```

6. If you use LAN1 to connect to the ADSL modem, add file /etc/ppp/options.eth0. If you use LAN2 to connect to the ADSL modem, then add /etc/ppp/options.eth1, etc.

```
name username@hinet.net
mtu 1492
mru 1492
defaultroute
noipdefault
~
~
~
"/etc/ppp/options.eth0" 5 lines, 67 characters
```

Type your username (the one you set in the /etc/ppp/pap-secrets and /etc/ppp/chap-secrets files) after the name option. You may add other options as desired.

7. Set up DNS.

If you are using DNS servers supplied by your ISP, edit the file /etc/resolv.conf by adding the following lines of code:

```
nameserver ip_addr_of_first_dns_server
nameserver ip_addr_of_second_dns_server
```

For example:

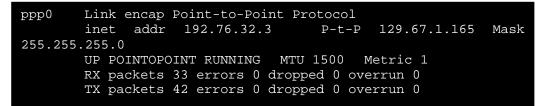

```
nameserver 168.95.1.1
nameserver 139.175.10.20
```

```
Moxa:/etc# cat resolv.conf
#
# resolv.conf This file is the resolver configuration file
# See resolver(5).
#
#
#nameserver 192.168.1.16
nameserver 168.95.1.1
nameserver 168.95.1.1
nameserver 139.175.10.20
nameserver 140.115.1.31
nameserver 140.115.236.10
Moxa:/etc#
```

8. Use the following command to create a **pppoe** connection: **#pppd eth0**

The ADSL modem is connected to the LAN1 port, which is named **eth0**. If the ADSL modem is connected to LAN2, use **eth1**, etc.

9. Type **#ifconfig ppp0** to check if the connection is OK. If the connection is OK, you should see the IP address of ppp0. Use **#ping** to test the IP address.

10. If you want to disconnect it, use the kill command to kill the **pppd** process.

NFS (Network File System) Client

The Network File System (NFS) is used to mount a disk partition on a remote machine (as if it were on a local hard drive), allowing fast, seamless sharing of files across a network. NFS allows users to develop applications for the DA-681-LX without worrying about the amount of disk space that will be available. The DA-681-LX supports only NFS client protocol.

ATTENTION

Click on the following links for more information about NFS.

http://www.tldp.org/HOWTO/NFS-HOWTO/index.html http://nfs.sourceforge.net/nfs-howto/client.html

The following procedures illustrate how to mount a remote NFS Server.

1.	. Scan the NFS Server's shared directory.		
	#showmount -e l	HOST	
	showmount:	Show the mount information of an NFS Server	
	-e:	Show the NFS Server's export list.	
	HOST:	IP address or DNS address	

- Establish a mount point on the NFS Client site.
 #mkdir -p /home/nfs/public
- Mount the remote directory to a local directory.
 #mount -t nfs 192.168.3.100/home/public /home/nfs/public

This is where 192.168.3.100 is the example IP address of the NFS server.

SNMP (Simple Network Management Protocol)

The DA-681-LX comes with the SNMP V1 (Simple Network Management Protocol) agent software pre-installed. It supports RFC1317 **RS-232 like group** and **RFC 1213 MIB-II**. The following example shows an SNMP agent responding to a query from the SNMP browser on the host site:

```
***** SNMP QUERY STARTED *****
[root@jaredRH90 root]# snmpwalk -v 1 -c public
192.168.30.128 more

```

ATTENTION

Click on the following links for more information about **RFC1317 RS-232** like group and **RFC 1213 MIB-II**.

http://www.tldp.org/HOWTO/NFS-HOWTO/index.html http://nfs.sourceforge.net/nfs-howto/client.html

OpenVPN

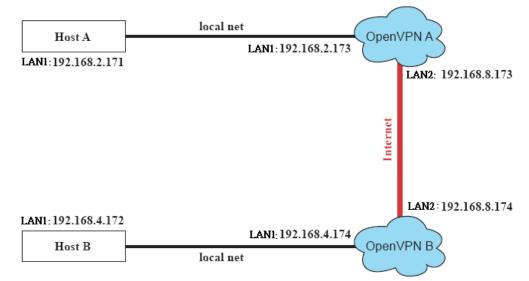

OpenVPN provides two types of tunnels for users to implement VPNS: **Routed IP Tunnels** and **Bridged Ethernet Tunnels**.

An Ethernet bridge is used to connect different Ethernet networks together. The Ethernets are bundled into one bigger, "logical" Ethernet. Each Ethernet corresponds to one physical interface (or port) that is connected to the bridge.

On each OpenVPN machine, you should carry out configurations in the **/etc/openvpn** directory, where script files and key files reside. Once established, all operations will be performed in that directory.

Ethernet Bridging for Private Networks on Different Subnets

1. Set up four machines, as shown in the following diagram.

Host A represents the machine that belongs to OpenVPN A, and Host B represents the machine that belongs to OpenVPN B. The two remote subnets are configured for a different range of IP addresses. When this configuration is moved to a public network, the external interfaces of the OpenVPN machines should be configured for static IPs, or connected to another device (such as a firewall or DSL box) first.

- Generate a preset shared key by typing the command:
 # openvpn --genkey --secret secrouter.key
- Copy the file that is generated to the OpenVPN machine:
 # scp /etc/openvpn/secrouter.key 192.168.8.174:/etc/openvpn

ATTENTION

A preshared key is located at **/etc/openvpn/secrouter.key**. You can use it for testing purposes. We suggest creating a new key for non-testing purpose.

4. On machine OpenVPN A, modify the remote address in the configuration file /etc/openvpn/tap0-br.conf.

```
# point to the peer
remote 192.168.8.174
dev tap0
secret /etc/openvpn/secrouter.key
cipher DES-EDE3-CBC
auth MD5
tun-mtu 1500
tun-mtu-extra 64
ping 40
up /etc/openvpn/tap0-br.sh
#comp-lzo
```

5. Next, modify the routing table in the /etc/openvpn/tap0-br.sh script file.

And then configure the bridge interface in /etc/openvpn/bridge.

```
#!/bin/bash
# Create global variables
# Define Bridge Interface
br="br0"
# Define list of TAP interfaces to be bridged,
# for example tap="tap0 tap1 tap2".
tap="tap0"
# Define physical ethernet interface to be bridged
# with TAP interface(s) above.
eth="eth1"
eth_ip="192.168.8.173"
eth_netmask="255.255.0"
eth_broadcast="192.168.8.255"
#gw="192.168.8.174"
...
```

Start the bridge script file to configure the bridge interface.

/etc/openvpn/bridge restart

DA-681 Series Linux User's Manual

6. On machine OpenVPN B, modify the remote address in configuration file /etc/openvpn/tap0-br.conf.

```
# point to the peer
remote 192.168.8.173
dev tap0
secret /etc/openvpn/secrouter.key
cipher DES-EDE3-CBC
auth MD5
tun-mtu 1500
tun-mtu-extra 64
ping 40
up /etc/openvpn/tap0-br.sh
#comp-lzo
```

7. Next modify the routing table in /etc/openvpn/tap0-br.sh script file.

And then configure the bridge interface in /etc/openvpn/bridge.

```
#!/bin/bash
# Create global variables
# Define Bridge Interface
br="br0"
# Define list of TAP interfaces to be bridged,
# for example tap="tap0 tap1 tap2".
tap="tap0"
# Define physical ethernet interface to be bridged
# with TAP interface(s) above.
eth="eth1"
eth_ip="192.168.8.174"
eth_netmask="255.255.0"
eth_broadcast="192.168.8.255"
#gw="192.168.8.173"
...
```

Start the bridge script file to configure the bridge interface.

/etc/openvpn/bridge restart

ATTENTION

Select cipher and authentication algorithms by specifying **cipher** and **auth**. To see which algorithms are available, type:

openvpn --show-ciphers
openvpn --show-auths

Start both OpenVPN peers on machine OpenVPN A and OpenVPN B.
 # openvpn --config /etc/openvpn/tap0-br.conf&

If you see the line **Peer Connection Initiated with 192.168.8.173:5000** on each machine, the connection between OpenVPN machines has been established successfully on UDP port 5000.

ATTENTION

You can create link symbols to start the OpenVPN service at boot time: # ln -sf /etc/init.d/openvpn /etc/rc2.d/S16openvpn

To stop the service, you should create these links: # ln -sf /etc/init.d/openvpn /etc/rc0.d/K80openvpn # ln -sf /etc/init.d/openvpn /etc/rc6.d/K80openvpn

9. On each OpenVPN machine, check the routing table by typing the command # route

Destination Use Iface	Gateway	Genmsk	Flags	Metric	Ref	
192.168.5.0 eth2	0.0.0.0	255.255.255.0	U	0	0	0
192.168.4.0 br0	0.0.0.0	255.255.255.0	U	0	0	0
192.168.3.0 eth0	0.0.0.0	255.255.255.0	U	0	0	0
192.168.30.0 eth3	0.0.0.0	255.255.255.0	U	0	0	0
192.168.8.0 br0	0.0.0.0	255.255.255.0	U	0	0	0

Interface **eth1** and device **tap0** both connect to the bridging interface, and the virtual device **tun** sits on top of **tap0**. This ensures that all traffic coming to this bridge from internal networks connected to interface eth1 write to the TAP/TUN device that the OpenVPN program monitors. Once the OpenVPN program detects traffic on the virtual device, it sends the traffic to its peer.

DA-681 Series Linux User's Manual

10. To create an indirect connection to Host B from Host A, you need to add the following routing item:

route add -net 192.168.4.0 netmask 255.255.255.0 dev eth0

To create an indirect connection to Host A from Host B, you need to add the following routing item:

route add -net 192.168.2.0 netmask 255.255.255.0 dev eth0

Now ping Host B from Host A by typing:

ping 192.168.4.174

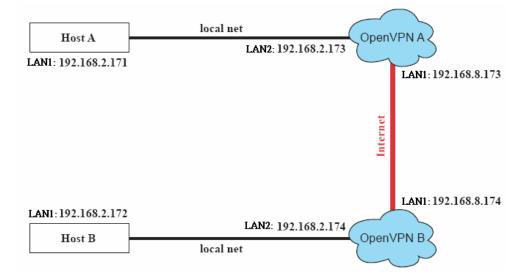

A successful ping indicates that you have created a VPN system that only allows authorized users from one internal network to access users at the remote site. For this system, all data is transmitted by UDP packets on port 5000 between OpenVPN peers.

11. To shut down OpenVPN programs, type the command:

killall -TERM openvpn

Ethernet Bridging for Private Networks on the Same Subnet

1. Set up four machines, as shown in the following diagram.

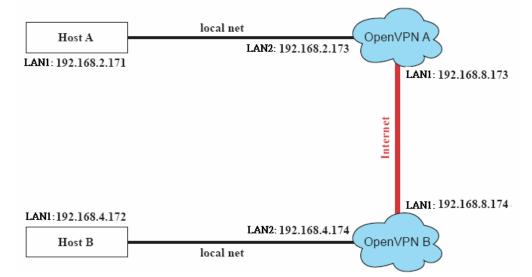

DA-681 Series Linux User's Manual

The configuration procedure is almost the same as for the previous example. The only difference is that you will need to comment out the parameter up in /etc/openvpn/tap0-br.conf of OpenVPN A and /etc/openvpn/tap0-br.conf of OpenVPN B.

```
# point to the peer
remote 192.168.8.174
dev tap0
secret /etc/openvpn/secrouter.key
cipher DES-EDE3-CBC
auth MD5
tun-mtu 1500
tun-mtu-extra 64
ping 40
#up /etc/openvpn/tap0-br.sh
#comp-lzo
```

Routed IP

1. Set up four machines, as shown in the following diagram.

2. On machine OpenVPN A, modify the remote address in configuration file /etc/openvpn/tun.conf.

```
# point to the peer
remote 192.168.8.174
dev tun
secret /etc/openvpn/secrouter.key
cipher DES-EDE3-CBC
auth MD5
tun-mtu 1500
tun-mtu-extra 64
ping 40
ifconfig 192.168.2.173 192.168.4.174
up /etc/openvpn/tun.sh
```

3. Next, modify the routing table in script file /etc/openvpn/tun.sh.

4. On machine OpenVPN B, modify the remote address in configuration file /etc/openvpn/tun.conf.

```
# point to the peer
remote 192.168.8.173
dev tun
secret /etc/openvpn/secrouter.key
cipher DES-EDE3-CBC
auth MD5
tun-mtu 1500
tun-mtu-extra 64
ping 40
ifconfig 192.168.4.174 192.168.2.173
up /etc/openvpn/tun.sh
```

And then modify the routing table in script file /etc/openvpn/tun.sh.

The first argument of parameter **ifconfig** is the local internal interface and the second argument is the internal interface at the remote peer.

\$5 is the argument that the OpenVPN program passes to the script file. Its value is the second argument of **ifconfig** in the configuration file.

5. Check the routing table after you run the OpenVPN programs, by typing the command # route.

Destination Gateway	Genmsk	Flags	Metric
Ref Use Iface			
192.168.4.174 *	255.255.255.255	UH	0
0 0 tun0			
192.168.4.0 192.168.4.174	255.255.255.0	UG	0
0 0 tun0			
192.168.2.0 *	255.255.255.0	U	0
0 0 eth1			
192.168.8.0 *	255.255.255.0	U	0
0 0 eth0			

4 System Recovery

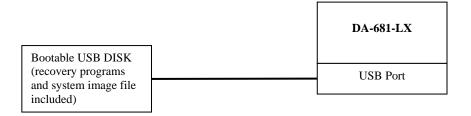

The DA-681-LX is installed with the Embedded Linux operating system, which is located in the Flash DOM (CompactFlash card) shipped with the DA-681-LX computer. Although it happens rarely, you may find on occasion that operating system files and/or the disk file system are damaged. This chapter describes how to recover the Linux operating system.

This chapter covers the following topics:

- **Recovery Environment**
- **Recovery Procedure**

Recovery Environment

The recovery environment includes the DA-681-LX embedded computer and a bootable USB disk with the recovery programs and system image file.

Recovery Procedure

Step 1: Format an Empty USB Disk.

- a. Prepare a USB disk that has at least a 256 MB capacity.
- b. Format your USB disk with the **HP USB Disk Format Tool**. Open the utility and select the device and FAT file system. You need empty disk only. DO NOT check the option **Create a DOS startup disk**.
- c. Click Start.

	e Format Tool, ¥2.0.6
<u>D</u> evice	
Kingston DataTrav	eler 2.0 1.00 (1947 MB) (G:\)
File system	
FAT

(1) (2) (2) (2) (2) (2) (2) (2) (2) (2) (2	nal MS-DOS system files
 using DUS 	system files located at
1	

ATTENTION

The HP USB Disk Storage Format Tool can be downloaded from many web sites. Do a search on **HP USB Disk Storage Format Tool** from any search engine to locate the tool.

Step 2: Create a Linux Bootable USB Disk.

- a. You can find the **firmware** directory in the Recovery CD shipped with the DA-681-LX computer.
- b. Configure Windows Explorer to show hidden files (including protected operating system files).
- c. Copy all files in the firmware directory to the root directory of your USB disk.
- d. Open a DOS prompt and type M:\syslinux.exe M: to create a bootable Linux disk. In this example, M: is the USB Disk drive number.

Step 3: Set up the BIOS to Boot from a USB Disk.

- a. Insert the USB disk.
- b. Power on and press **DEL** to enter the bios setup menu.
- c. Select Advanced \rightarrow Hard Disk Boot Priority and then press Enter.

Phoenix - AwardBIOS CMOS Setup Utility Main Advanced Peripherals Power HW Monitor Defaults Exit

- e. Press "+" to move the selection up to the first priority, and press **Esc** to exit the setup menu.
- f. Make sure the first boot device is Hard Disk. If not, press Enter to change it.
- g. Select Exit \rightarrow Save & Exit Setup and then press Enter.
- h. Choose Y to save to the CMOS and then exit.

Step 4: Recover the Linux system from a USB Disk.

a. If the BIOS setup is correct, it will boot from the USB disk. Follow the steps below to set up recovery parameters.

Welcome to PING (Partition Image Is Not Ghost)!	
This tool can be used to both backup a Ghost-like image of your hard disk and to restore your hard disk from such an image. Please, be aware that if you choose to restore your hard disk. All the data contained on this computer might be lost during the restoration. You man choose to abort now, by stopping the computer now.	
< <u>CK></u>	

- b. Choose **OK** to go to the next step.
- c. Choose shut down the DA-680-LX when the restoration is finished.

PING (Partition Image Is Not Ghost)!	
When the job is completed, do you want to Get a shell (root) Reboot the system Shutdown	

d. Choose restore image from Local disk partition.
