Welcome to Moxa *NPort 6110 Modbus/TCP to Serial Communication Gateway*, an easy-to-use Ethernet to RS-232/422/485 Modbus Gateway.

This chapter is an introduction to NPort 6110 and includes the following sections:

- Overview
- Features
- Product Specifications
- Package Checklist
- □ Front/Top/Rear/Bottom Panel Views

## Overview

Moxa NPort 6110 Modbus/TCP to Serial Communication Gateway provides users with many excellent benefits, including:

- Seamless integration of Ethernet and serial Modbus devices
- Powerful operation modes for versatile Modbus applications
- · Windows utility for easy setup and traffic monitoring

Each of these benefits is explained in more detail below.

#### Seamless integration of Ethernet and serial Modbus devices

Modbus is one of the most popular automation protocols in the world. Modbus protocol supports traditional RS-232/422/485 devices and newly developed Ethernet devices. Many industrial devices, such as PLCs, DCSs, HMIs, instruments, and meters, use Modbus as their communication standard. However, the Modbus protocols that run over serial and Ethernet are so different that a communication gateway is needed as a bridge for integration.

NPort 6110 supports one Ethernet and one software selectable RS-232/422/485

port that can connect to many types of Modbus device. By translating Modbus/TCP (Ethernet) and Modbus/ASCII/RTU (Serial) protocols, a PLC with Ethernet can use the RS-232/485 interface to seamlessly communicate with instruments.

#### Powerful operation modes for versatile Modbus applications

For Modbus protocol conversions, it is necessary to define a Master and Slave device, but unlike other Modbus Gateways, NPort 6110 allows users to configure Master/Slave for both the Ethernet and serial sides.

Extra address mapping and exception parameters are provided to ensure that most situations can be handled.

#### Windows utility for easy setup and traffic monitoring

NPort 6110 is powerful yet very easy to use. An intuitive Windows utility automatically searches for all available NPort 6110 units on the LAN.

Traffic Monitoring within the utility helps you troubleshoot any Modbus communication problem, such as connection status check, or address translation error check.

## Features

- □ Integration of Modbus serial and Modbus Ethernet devices
- Supports connecting a Modbus/TCP Master device to up to 31 Modbus/ASCII/RTU slave devices
- Supports connecting a Modbus/ASCII/RTU master device to up to 12 Modbus/TCP slave devices
- □ Easy-to-use Windows utility for configuration over Ethernet
- □ 10/100M fast Ethernet with automatic IP setting (DHCP)
- □ One software selectable RS-232/485/422 interface
- □ High speed serial interface—up to 230.4 Kbps

## **Product Specifications**

#### LAN

#### **Serial Communication Parameters**

Parity	None, Even, Odd, Mark, Space
Data Bits	7, 8
Stop Bit	1, 2
Flow Control	RTS/CTS, XON/XOFF
Speed	1200 bps to 230.4 Kbps

#### **Software Features**

Internet Protocols	DHCP, BootP, TCP, UDP, IP, ICMP, ARP
Modbus Protocols	Modbus/TCP, Modbus/ASCII, Modbus/RTU,
	Master/Slave modes supported
Utilities	Modbus Gateway Configurator for Windows
	95/98/Me/NT/2000/XP
Configuration	Windows utility via Ethernet

#### **Power Requirements**

Power Input	9 to 30 VDC
Power Consumption	300 mA at 12V (max.)

#### **Mechanical Specifications**

Material	Aluminum sheet metal (1 mm)
Gross Weight	0.88 kg (1.94 lb)

#### Environmental

Operating Temperature0 to 55°C (32 to 131°F), 5 to 95% RHStorage Temperature-20 to 85°C (-4 to 185°F), 95% RH

#### **Regulatory Approvals**

EMC Safety FCC Class B, CE Class B CUL, TÜV

## Package Checklist

NPort 6110 Modbus/TCP to Serial Communication Gateway with 100-240 VAC power adaptor (US, Euro plugs included)

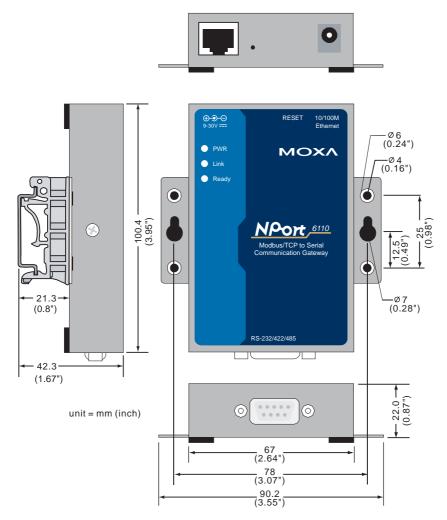

#### All models include:

- NPort 6110
- Software and documentation CD-ROM
- 100-240 VAC power adapter, US plug, 12V, 400 mA
- Euro plug included

#### **Optional Accessories:**

• DK-35A DIN-Rail Mounting Kit (35 mm)

## Front/Top/Rear/Bottom Panel Views

## **2** Getting Started

This chapter includes:

- Power Connection
- Serial Installation
- Ethernet Installation
- Software Installation
- □ Housing
  - DIN-Rail
  - ➢ Wall Mount

## **Power Connection**

Take the following steps to connect NPort 6110's power adapter.

- 1. Plug the power adapter's DC plug into NPort 6110's DC-IN jack.
- 2. Plug the power adapter into an electrical outlet.

Note that there is no on/off switch. NPort 6110 automatically turns on when plugged into the outlet, and the red PWR light on NPort 6110's top panel will glow to indicate that it is receiving power.

## **Serial Installation**

NPort 6110 has one male DB9 serial port on the back panel. Depending on your serial device and serial interfaces, there are two options:

- 1. You may use a DB9 to DB9 cable to connect your serial device to NPort 6110. Plug one end of the cable into the port on the back panel of NPort 6110 and plug the other end into your serial device's serial port.
- 2. Refer to Chapter 8 for details of NPort 6110's DB9 pinouts to make your own serial interface cable.

## **Ethernet Installation**

There are two ways to use the 10/100BaseT Ethernet jack located on NPort 6110's front panel:

- 1. For most applications using NPort 6110, you will simply plug one end of an Ethernet cable into NPort 6110's 100BaseT jack, and plug the other end into an Ethernet hub/switch connected to your network. In this case, use a regular *straight-through* Ethernet cable.
- 2. When configuring NPort 6110, you may connect NPort 6110 directly to your computer's Ethernet connector. NPort 6110 versions 2.3 and above include automatic crossover, so a crossover cable is not required. For previous versions, you will need to use a crossover Ethernet cable when connecting the server directly to your computer..

The amber Link light will flicker when NPort 6110 is properly connected to a live Ethernet connection.

## **Software Installation**

Follow the instructions given below to install **Modbus Gateway Configurator**, the utility that allows you to configure and monitor multiple NPort 6110 units over the network.

1. Insert the software CD-ROM that came with NPort 6110 into the CD-ROM drive, and then double click on the **Setup.exe** icon that installs the NPort Modbus Gateway Utility.

2. You will be greeted by the Welcome window. Click on Next to continue.

3. Enter your **Name** and **Company** name in the spaces provided, and then click on **Next** to continue.

User Information		×	1
	Type your n company yo	ame below. You must also type the name of the u work for.	
	N <u>a</u> me:	Tim Stemple	
	<u>C</u> ompany:	Moxa Technologies	
InstallShield		< Back Next > Cancel	

4. When the **Choose Destination Location** window appears, click on **Next** to continue. If you would like to use a Destination Directory different than the one displayed, first click on **Browse...** to locate your folder of choice, and then click on **Browse**.

Choose Destination Loc	ation X		
InstallShield	Setup will install Modbus Gateway Configurator in the following directory. To install to this directory, click Next. To install to a different directory, click Browse and select another directory. You can choose not to install Modbus Gateway Configurator by clicking Cancel to exit Setup.		
	Destination Directory C:\\Modbus Gateway Configurator Browse		

5. If desired, modify the highlighted name in the Program Folders text box (this is the name that will appear under Start → Programs) and then click on Next to continue.

Select Program Folder		х
Instalibited	Setup will add program icons to the Program Folder listed below. You may type a new folder name, or select one from the existing Folders list. Click Next to continue. Program Folders: NPort Modbus Gateway Utility Existing Folders: Accessories MCXA Utilities NPort Asin SDK Utility NPort Management Suite PComm Lite 2.5 StartUp Triend OfficeScan Win95	
	< <u>B</u> ack <u>N</u> ext > Cancel	

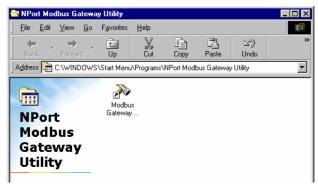

6. Click on Next to start copying the software files.

Start Copying Files	×
	Setup has enough information to start copying the program files. If you want to review or change any settings, click Back. If you are satisfied with the settings, click Next to begin copying files.
	Current Settings:

	Target Folder C:\Program Files\M0XA\Modbus Gateway Configurator
	User Information Name: Tim Stemple Company: Moxa Technologies
	۲ ۲
	< <u>B</u> ack <u>Next&gt;</u> Cancel

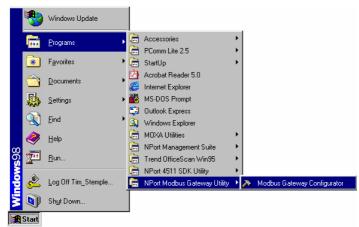

7. Wait patiently while the files are being copied. The procedure should only take a few seconds.

Decompressing Files In C:\Program Files\M0XA\Modbus nport6110.chm			
	18 %		
	[Cancel]		

8. The NPort Modbus Gateway Utility folder will open showing the Modbus Gateway Configurator icon.

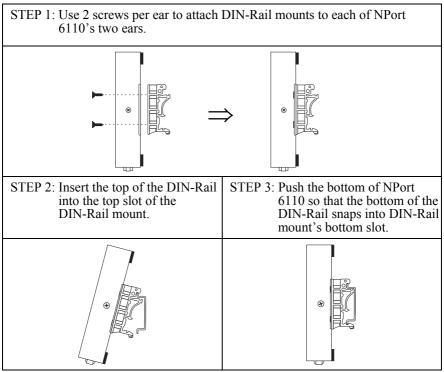

9. You may also view this program shortcut by clicking on Start → Programs → NPort Modbus Gateway Utility → Modbus Gateway Configurator, as shown below.

## Housing

## DIN-Rail

For many industrial applications, you will find it convenient to use the DIN-Rail attachments, as shown below.

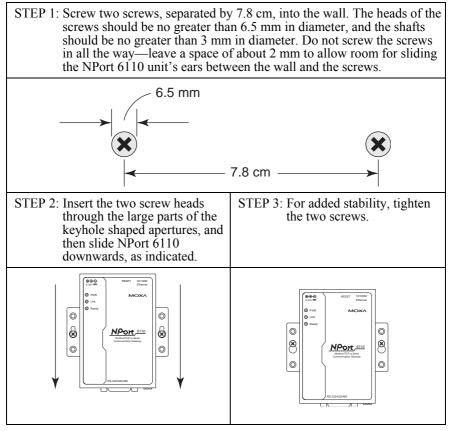

NOTE: The DIN-Rail mounting kit is an optional accessory.

To remove NPort 6110 from the DIN-Rail, simply reverse Steps 2 and 3 above. Grasp the bottom of the NPort 6110 unit with both hands, and then use your fingers to pull down slightly on the bottom slot of the DIN-Rail mounts to release the bottom of the DIN-Rail from the DIN-Rail mount.

## Wall Mount

For many industrial applications, you will find it convenient to mount NPort 6110 on the wall, using two screws, as indicated below.

To remove NPort Express from the wall mount, simply reverse Steps 2 and 3.

## **3** Typical Modbus Applications

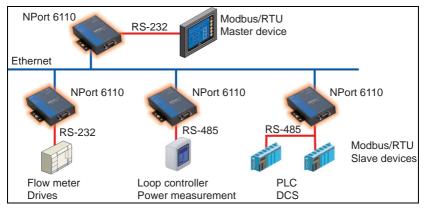

In this chapter, we introduce three typical Modbus applications.

# Serial master device talks to serial slave devices over the Internet

Let traditional Modbus serial devices talk over the Internet...

Many traditional serial Modbus devices can talk over RS-485, but the RS-485 network limits the maximum number of Modbus devices to 32, provided the transmission distance does not exceed 1.2 km.

By using Modbus Gateway, you can link all Serial Modbus devices over an Ethernet network. Modbus Gateways can be installed in the same control network, extending the coverage of a single Modbus network as far as a TCP/IP network can reach.

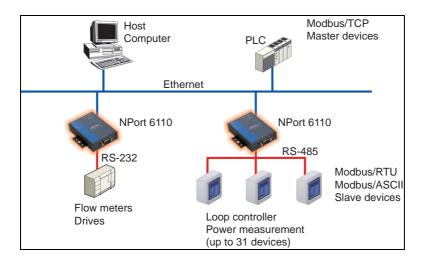

# Ethernet master devices talk to multiple serial slave devices

Connect all Modbus devices over the Ethernet network...

Most host computers and newly developed PLCs support the Ethernet interface and run Modbus/TCP. NPort 6110 Modbus Gateway is needed to link discrete Serial Modbus Devices for data collection and control.

Each NPort 6110 supports Modbus/TCP over Ethernet, which allows up to 7 connections. The software configurable serial interface supports either RS-232 or RS-422/485. In RS-232/422 modes, NPort 6110 can be connected to 1 serial device. Under RS-485 mode, NPort 6110 supports up to 31 serial devices, which is the most popular application for factory floor applications.

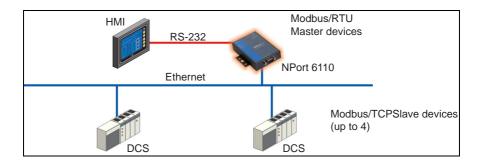

## Serial master devices talk to multiple Ethernet slave devices

Link the Serial Master device with Ethernet Slave devices...

Many HMI (Human Machine Interface) systems use a serial interface and are required to access a discrete DCS (Data Control System). These days however, more and more DCSs support Ethernet and run under Modbus/TCP slave mode.

In this case, NPort 6110 Modbus Gateway is the ideal solution to link the HMI to distributed DCSs over an Ethernet network. Up to 12 Modbus/TCP slave devices are supported by each NPort 6110.

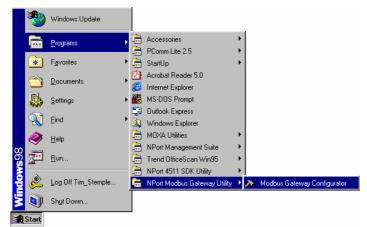

## **Configuring Modbus Gateway**

We discuss the following topics in this chapter:

- □ Starting Modbus Gateway Configurator
- □ Searching for NPort 6110
  - Broadcast Search
  - Specify by IP Address
- Modify Configuration
  - Network Settings
  - Modbus Settings
  - Advanced Modbus Settings
  - Modbus Serial Settings
  - > Password
- Other Functions
  - > Unlock
  - Upgrade Firmware
  - Remote Monitoring and Management
  - Start Log Monitor

## **Starting Modbus Gateway Configurator**

To start Modbus Gateway Configurator, click on Start  $\rightarrow$  Programs  $\rightarrow$  NPort Modbus Gateway Utility  $\rightarrow$  Modbus Gateway Configurator.

The Modbus Gateway Configurator window will open as shown below.

🔉 Modbus Ga	teway Config	gurator						_ 🗆	×
Locate Gateway	<u>C</u> onfiguratio	n L <u>og</u> Monitor	<u>F</u> irmware <u>W</u> ir	ndows <u>H</u> elp

•								•	
2003/03/26 16:5	3:25 Funtio	n	Messag	je					_

## Searching for NPort 6110

There are two methods available to search the network for NPort 6110s. **Broadcast Search** is used to locate all NPort 6110s connected to the same LAN as the host, and **Search by IP** is used to locate a specific NPort 6110, particularly if it is located outside the LAN and can only be accessed by going through a router.

#### **Broadcast Search**

To use the Broadcast Search function, click on the Broadcast Search icon from the toolbar, or select Broadcast Search under the **Locate Gateway** menu.

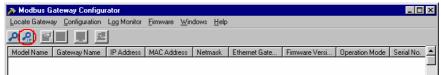

🔊 Modbus Gateway Config	jurator			
Locate Gateway Configuration	n L <u>og</u> Monitor	<u>F</u> irmware	<u>W</u> indows	<u>H</u> elp
	2			
Model Name Gateway Name	e IP Address	MAC Add	ress Net	mask

After the search is complete, information related to all NPort 6110s located on the LAN will be displayed in the Modbus Gateway Configurator window.

	🔉 Mod bus Gate	way Configurator								×
	<u>L</u> ocate Gateway	<u>C</u> onfiguration	Log Monitor	<u>F</u> irmware <u>W</u> :	indows <u>H</u> elj	p				
l	이유 페르 핏 보									
	Model Name	Gateway Name	IP Address	MAC Address	Netmask	Ethernet Gate	Firmware Versi	Operation Mode	Serial No.	
	Model Name NPort 6110	Gateway Name Sample_05	IP Address 192.168	MAC Address 00:90:e8:04	Netmask 255.255	Ethernet Gate 0.0.0.0	Firmware Versi V1.0	Operation Mode Running	Serial No. 7	
									Serial No. 7	-

### Specify by IP Address

To use the Specify by IP Address function, click on the Specify by IP Address icon from the toolbar, or select Specify by IP Address under the **Locate Gateway** menu.

When the **Search by IP Address** window opens, input the IP address of the NPort 6110 you want to search for, and then click **OK**.

Search IP by Address		×
IP Address	192.168.210.105	
0	K Cancel	

If the search is successful, information related to the NPort 6110 will be displayed in the Modbus Gateway Configurator window.

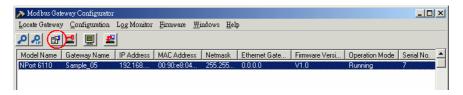

🔊 Modbus Gat	eway Configurator							_ 🗆	×
Locate Gateway	/ <u>C</u> onfiguration	Log Monitor	<u>F</u> irmware <u>W</u>	indows <u>H</u> elp	p				
ନ 🖉 🔤									
Model Name	Gateway Name	IP Address	MAC Address	Netmask	Ethernet Gate	Firmware Versi	Operation Mode	Serial No.	
Model Name NPort 6110	Gateway Name Sample_05	IP Address 192.168	MAC Address 00:90:e8:04	Netmask 255.255	Ethernet Gate 0.0.0.0	Firmware Versi V1.0	Operation Mode Running	Serial No. 7	
								Serial No. 7	

**NOTE** If using the Search by IP Address function fails to locate the NPort 6110, one possible reason is that the IP address you entered to conduct the search is incorrect. Try retyping the IP address and then redo the search.

Another possibility is that the NPort 6110 is located on the same LAN as the host, but on a different subnet. In this case, you can change the IP address and/or Netmask of the host so that it is on the same subnet as the NPort 6110.

## **Modify Configuration**

To modify the configuration of an NPort 6110, first click on the row associated with the NPort 6110 whose configuration you want to modify (to highlight the row, as shown in the following figure). Next, click on the **Modify Configuration** toolbar icon, or select Modify Configuration under the **Configuration** menu.

The **Configuration** window opens to the **Network Settings** page. Refer to the following subsections to learn more about how to configure NPort 6110's various settings.

#### **Network Settings**

The Network Settings page is used to configure Modbus Gateway Name, IP Address, Netmask, Default Gateway, and IP Configuration. At the top of the page you may also view the Model Name, MAC Address, and Serial Number of the NPort 6110. These three parameters are set at the factory and cannot be modified by the user.

**NOTE** To modify a setting, first checkmark the box to the left of the setting's name to activate the setting's text input box.

Netmask	32-bit number, default = 255.255.255.0	Identifies the server as belonging to a Class A, B, or C network.			
Default Gateway	32-bit number, default =0.0.0.0	IP address of the router that provides network access outside the server's LAN.			
IP Configuration	Choose from Static IP, DHCP, BootP, or DHCP/BootP.	<ol> <li>Choose Static IP if you are using a fixed IP address.</li> <li>Choose one of the other options if the IP address is set dynamically.</li> </ol>			

#### Modbus Settings

The Modbus Settings page is used to set up the Attached Serial Device type, Initial delay time, and Modbus/TCP Slave device settings.

**NOTE** To modify the settings on this page, first checkmark the **Change Modbus** Settings box.

The **Modbus/TCP Slave device settings** are only active if the attached serial device is set as one of the two Master types.

Choose the Modbus protocol of the attached serial device to determine the complementary Modbus protocol for the NPort 6110 Modbus Gateway. Four different types of serial Modbus device can be used. Since the Modbus protocol is used on a Master-Slave network, there are two steps to consider before starting the configuration process. The first step is to determine which devices are Masters and which are slaves (either Ethernet or Serial device). Next, you need to determine the Modbus protocol that the serial device uses.

Modbus Settings					
Setting	Value	Notes			
	Modbus RTU Slave <sup>1</sup>				
Attached Serial Device type	Modbus ASCII Slave <sup>2</sup>	Set the Modbus type of the serial device attached to			
Attached Senar Device type	Modbus RTU Master <sup>3</sup>	NPort 6110's serial port.			
	Modbus ASCII Master <sup>4</sup>				
Initial delay time	100 to 3276 ms; default = 100 ms	NPort Modbus Gateway provides this setting for those PLCs that need a longer time for their system to be initialized.			
Modbus/TCP Slave device se	etting				
Remote Modbus Slave IP	IP address assigned to the remote Modbus slave device.	Valid when the attached serial device is a Modbus RTU/ASCII Master.			
TCP Port No.	default = 502	Set this value to 0 (zero) to disable the corresponding Modbus/TCP slave device.			
ID No. Range	1 to 247	The unique Modbus ID number assigned to the Modbus device. <sup>5</sup>			

#### Additional Information

- 1. When the serial Modbus device is running in Modbus/RTU Slave mode, the NPort Modbus Gateway is ready to connect automatically to Modbus/TCP Master devices. Up to 7 Modbus/TCP master devices can connect to one serial Modbus slave device.
- 2. Modbus ASCII Slave mode works the same as Modbus/RTU slave mode, except that the data format is Modbus/ASCII.
- 3. When the serial Modbus device is running in Modbus/RTU Master mode, the NPort Modbus Gateway is ready to connect automatically to Modbus/TCP slave devices. You will also need to configure the IP address for up to 12 Modbus/TCP slave devices that can be connected to over the Ethernet network.

- 4. Modbus ASCII Master mode works the same as Modbus/RTU Master mode, except that the data format is Modbus/ASCII.
- 5. When the NPort Modbus Gateway receives a command from the serial port, the ID No. range table is used identify which IP address to connect to (e.g., if ID No. = 15, then according to the table in the Modbus Settings page shown above, the command is sent to the device that has IP of 192.168.127.3.

#### Advanced Modbus Settings

The Advanced Modbus Settings page is used to set up the Auto Slave Unit ID, Character Timeout, Message Timeout, and Modbus/TCP Exception.

**NOTE** To modify the settings on this page, you must first checkmark the **Change Modbus Settings** box at the top of the **Modbus Settings** page.

work Settings Modbus Settings	Advanced Mo	odbus Settings	Modbus Serial Settings Password	
Auto Slave Unit ID	nable 💌	0	(ID No. 1 - 247) Replace ID No. When the setting is disc	abled
Character Timeout 10	0	(10 - 3000ms)		
Message Timeout 10	100_	(10 - 3000ms)		
Modbus/TCP Exception	es 💌			
			ОК	Cancel

Advanced Modbus Settings					
Setting	Value	Notes			
Auto Slave Unit ID	Enable (Default)	Select Enable when multiple Modbus devices			
	Disable	are accessible at the same IP address. <sup>1</sup>			
Character Timeout	10 to 3000 ms (default = 100 ms)	This parameter is active when the attached serial device is set to Modbus/RTU. <sup>2</sup>			
Message Timeout	10 to 3000 ms (default = 1000 ms)	Allows you to configure the message timeout for communication between connected Ethernet or serial Modbus devices.			
Modbus/TCP Exception	default = Yes	This parameter is active when the Modbus Gateway connects a Modbus/TCP Master with Modbus serial slave devices. <sup>3</sup>			

#### Additional Information

1. Modbus/TCP protocol contains a "Unit ID" field to identify multiple Modbus slave devices accessible at a single IP address. When the Modbus/TCP command contains a Unit ID, the Modbus Gateway can pass the Unit ID to Modbus serial devices. This allows you to link to multiple serial devices with a Modbus Gateway. Some PLCs assume that each IP connects to only one device. In these cases, the Unit ID can be set "0," but you must manually assign a Unit ID (between 1 and 247) to the connected serial device. However, each Modbus Gateway can connect to only one serial device.

This setting is valid when [Attached Serial Device type] is set to [Modbus RTU Slave ] or [Modbus ASCII Slave].

Enable: Uses the Unit ID in the Modbus/TCP packet. This is the default setting.

Disable: Uses the predefined Unit ID instead of Modbus/TCP's.

- ID: The predefined Unit ID value, ranging from 1 to 247, which is valid
- 4-10

when Auto Slave Unit ID is "Disabled."

- 2. When the Modbus serial protocol is set to Modbus/RTU, each message packet is determined by a character timeout. An incorrect character timeout might cause a CRC checksum error. NPort Modbus Gateway allows a variable character time out setting, ranging from 10 to 3000 ms, when the attached serial device is set to Modbus/RTU.
- 3. This setting is in effect when the Modbus Gateway connects a Modbus/TCP Master with Modbus serial slave devices. When the Modbus Gateway can't get a response from Modbus serial devices, the Modbus serial protocol will not respond to the master device. However, the TCP protocol has a longer waiting time, which could cause a network traffic problem for Modbus/TCP. For this reason, Modbus Gateway can automatically send a Modbus Exception Code 10 to the Modbus/TCP master device when there is no response from the Modbus serial slave devices, making overall network communication much more efficient.
  - Yes: default.
  - No: No Modbus/TCP exception handling.

## Modbus Serial Settings

The Modbus Serial Settings page is used to configure NPort 6110's DB9 Male port. You can configure Interface Mode, Baud Rate, Parity, Data Bits, Stop Bit, Flow Control, and UART FIFO.

**NOTE** To modify the settings on this page, you must first checkmark the **Change Modbus Settings** box at the top of the **Modbus Settings** page.

work Settings   M	odbus Settings	Advanced Modbu	us Settings Mod	bus Serial Settin	gs Password	
Port 1						
Interface Mode	RS-232	•				
Baud Rate	19200	-	Flow Control	None	<b>T</b>	
Parity	None		UART FIFO	Enable		
Data Bits	8	•				
Stop Bit	1	•				
					OK Ca	ancel

Modbus Serial Settings					
Setting	Value	Notes			
	RS-232				
Interface Mode	RS-422	NPort 6110 supports 2-wire RS-485 mode.			
	RS-485				
Baud Rate	1200 bps to 230400 bps				
Parity	None, Odd, Even, Space, Mark				
Data Bits 7, 8		ASCII = 7; RTU = 8			
Stop Bit	1, 2				
Flow Control	None, Xon/Xoff, RTS/CTS				
UART FIFO	Enable, Disable				

## Password

Use the Password page to set a password, change the password, or erase the password.

**NOTE** To modify the settings on this page, you must first checkmark the **Change Password** box at the top of the **Password** page.

To erase an existing password, leave both the **New Password** and **Confirm Password** text input boxes blank, and then click **OK** in the bottom right corner of the window.

## **Other Functions**

The Unlock, Start Log Monitor, and Upgrade Firmware functions are described in this section.

## Unlock

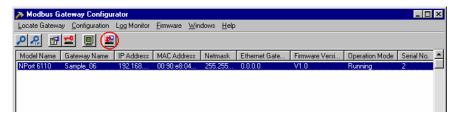

The Unlock function is used for NPort 6110 units that are password protected. To use the function, first click on the NPort 6110 that you wish to unlock to highlight it, and then click on the Unlock toolbar icon, or select Unlock under the Configuration menu.

🔊 Modbus G	ateway Configu	rator						_ 🗆	×

## Upgrade Firmware

Use the Upgrade Firmware function to upgrade NPort 6110's firmware, which can be downloaded from the Moxa website at www.moxa.com.

To use this function, first click on the NPort 6110 whose firmware you want to download to highlight it, and then click on the Upgrade Firmware toolbar icon, or select Upgrade under the Firmware menu.

When the **Open** window appears, navigate to the folder that contains the NPort 6110 firmware file, and then click on the file name. Make sure the correct filename appears in the File name box, and then click on the **Open** button to start downloading the firmware.

	Upgrade Firmware	×
Open ?X Look in NFFm I D M I D NPont5100m	Server Name: Sample_06 IP Address: 192.168.210.104 Status: Finish	
File game:         NPon6110.tm         Open           Files of type:         1.tm         Cancel	Close	

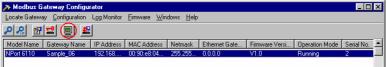

Once the downloading process ends, click on **Close** to close the Upgrade Firmware window. The **Broadcast Search** function will be activated automatically and search the LAN for all NPort 6110s.

## Remote Monitoring and Management

To troubleshoot and manage Modbus-based device connectivity, information such as TCP/IP, Modbus protocol type, and Master/Slave type are important. NPort Modbus Gateway provides a powerful function that allows you to monitor the operation of each Modbus Gateway on the Internet. The log monitor records detailed actions, such as operation modes, serial communication parameters, and TCP/IP connectivity for the NPort Modbus Gateway. These records include date/time and can be saved as a text file for maintenance or service record.

### Start Log Monitor

To start the Log Monitor, first click on the NPort 6110 you wish to monitor to highlight it, and then click on the **Start Log Monitor** toolbar icon, or select **Start** under the **Log Monitor** menu.

A Log Monitor window specific to the selected NPort 6110 will appear in the bottom half of the Modbus Gateway Configurator window. Note that you can open a separate Log Monitor window for other listed NPort 6110s by repeating this process.

To start capturing the operation log, press the **Start Log Monitor** button **D**. The operation log appears with time stamp stating connection status for connected Modbus devices. To keep a record of this monitor session, save the log to a text file. To clear all the records, press the **Log Monitor Flush** button

In this chapter, we give answers to some common troubleshooting questions related to Modbus Gateway applications.

#### 1. ID No. mismatch

ID number mismatch is the most common field installation problem encountered. First, make sure the ID number of each Modbus device corresponds to the settings in the automation software on the computer. Pay attention to Modbus Gateway's configuration to avoid ID number issues.

- 1.1 When [Attached Serial Device] is set to [Modbus/RTU Slave] or [Modbus/ASCII Slave], and the [Auto Slave Unit ID] is disabled, the Modbus Gateway will use a fixed ID number. Make sure the ID number of the serial device is identical to the settings in the Modbus Gateway.
- 1.2 When [Attached Serial Device] is set to [Modbus/RTU Master] or [Modbus/ASCII Master], the Modbus Gateway replies on [ID No. Range] to transfer the serial Modbus device command to the IP address of the correct Modbus/TCP device. The ID number in the Ethernet device and Modbus/TCP slave device setting table must match.

#### 2. Modbus Address configuration error

Basically, Modbus Gateway will not change the Modus address in the data packet of the protocol. When your automation software or device reports address error, check that the address setting on the device is correct.

#### 3. Proper character timeout configuration for Modbus/RTU

A Modbus/RTU device requires character timeout for data packet segmentation. When a CRC error occurs, you may need to increase the character timeout in Modbus Gateway.

#### 4. HMI polling time and timeout interval issue

When [Attached Serial Device] is set to [Modbus/RTU Slave] or [Modbus/ASCII Slave], each Modbus Gateway accepts up to 7 connections from Modbus/TCP master devices. However, the Ethernet speed is much higher than the Serial speed. Therefore, proper polling time and timeout interval settings are required to prevent timeout error. For a particular HMI monitoring system, the best configuration is: polling time set to 0.5 - 1.0 sec, Timeout interval 3 sec.

NPort 6110 supports three serial interfaces: RS-232, RS-422, and 2-wire RS-485. In this chapter, we give the DB9 Male pinouts for each of these three interfaces.

Pin No.	RS-232	RS-422	RS-485	
1	DCD	TxD-(A)	Data-	1 2 3 4 5
2	RxD	TxD+(B)	Data+	
3	TxD	RxD+(B)		
4	DTR	RxD-(A)		
5	GND	GND	GND	- \ o o o o /
6	DSR	RTS-(A)		
7	RTS	RTS+(B)		
8	CTS	CTS+(B)		6789
9		CTS-(A)		-

## **RETURN PROCEDURE**

For product repair, exchange, or refund, the customer must:

- Provide evidence of original purchase.
- Obtain a Product Return Agreement (PRA) from the sales representative or dealer.
- Fill out the Problem Report Form (PRF). Include as much detail as possible for a shorter product repair time.
- Carefully pack the product in an anti-static package, and send it, pre-paid, to the dealer. The PRA should be visible on the outside of the package, and include a description of the problem, along with the return address and telephone number of a technical contact.
