Safety relay for monitoring E-STOP pushbuttons, safety gates and light beam devices

Approvals

	PNOZ s5
c(UL)us LISTED	◆
TÜV SÜDDEUTSCHLAND	◆
CCC	◆

Unit features

▶ Positive-guided relay outputs:
– 2 safety contacts (N/O), instantaneous
– 2 safety contacts (N/O), delay-on de-energisation
▶ 1 semiconductor output
▶ Connection options for:
– E-STOP pushbutton
– Safety gate limit switch
– Reset button
– Light barriers
– PSEN
▶ A connector can be used to connect 1 PNOZsigma contact expander module
▶ Delay-on de-energisation selectable
▶ Operating modes and delay times can be selected via rotary switches
▶ LED indicator for:
– Supply voltage
– Input status, channel 1
– Input status, channel 2
– Switch status channel 1/2
– Reset circuit
– Error
▶ Plug-in connection terminals (either spring-loaded terminal or screw terminal)

▶ See order reference for unit types

Unit description

The safety relay meets the requirements of EN 60947-5-1, EN 60204-1 and VDE 0113-1 and may be used in applications with
▶ E-STOP pushbuttons
▶ Safety gates
▶ Light beam devices

Safety features

The relay meets the following safety requirements:
▶ The circuit is redundant with built-in self-monitoring.
▶ The safety function remains effective in the case of a component failure.
▶ The correct opening and closing of the safety function relays is tested automatically in each on-off cycle.
▶ The unit has an electronic fuse.

Up to PL e of EN ISO 13849-1
PNOZ s5

Function description

- Single-channel operation: no redundancy in the input circuit, earth faults in the reset and input circuit are detected.
- Dual-channel operation without detection of shorts across contacts: redundant input circuit, detects
  - earth faults in the reset and input circuit,
  - short circuits in the input circuit and, with a monitored reset, in the reset circuit too.
- Dual-channel operation with detection of shorts across contacts: redundant input circuit, detects
  - earth faults in the reset and input circuit,
  - short circuits in the input circuit and, with a monitored reset, in the reset circuit too,
  - shorts between contacts in the input circuit.
- Automatic start: Unit is active once the input circuit has been closed.
- Manual reset: Unit is active once the input circuit is closed and then the reset circuit is closed.
- Monitored reset with falling edge: Unit is active once
  - the input circuit is closed and then the reset circuit is closed and opened again.
  - the reset circuit is closed and then opened again once the input circuit is closed.
- Monitored reset with rising edge: Unit is active once the input circuit is closed and once the reset circuit is closed after the waiting period has elapsed (see technical details).
- Reset with start-up test: The unit checks whether safety gates that are closed are opened and then closed again when supply voltage is applied.
- Ability to increase the number of contacts available on the
  - instantaneous safety contacts by using connectors to link to a PNOZsigma contact expansion module
  - delayed/instantaneous safety contacts by connecting contact expansion modules or external contactors

Timing diagram

Key

- Power: Supply voltage
- Reset/Start: Reset circuit S12-S34
- Input: Input circuits S11-S12, S21-S22
- Output safe: Safety contacts 13-14, 23-24
- Out semi: Semiconductor outputY32
- ①: Automatic reset

- ②: Manual reset
- ③: Monitored reset with rising edge
- ④: Monitored reset with falling edge
- ⑤: Reset with start-up test
- a: Input circuit closes before reset circuit
- b: Reset circuit closes before input circuit

- t_1: Switch-on delay
- t_2: Delay-on de-energisation
- t_3: Waiting period
- t_4: Waiting period reset circuit was closed
- t_5: Delay time
- t_6: Minimum time safety gates open

Wiring

Please note:
- Information given in the "Technical details" must be followed.
- Outputs 13-14, 23-24 are instantaneous safety contacts, outputs 37-38, 47-48 are delay-on de-energisation safety contacts.
- To prevent contact welding, a fuse should be connected before the output contacts (see technical details).
- Calculation of the max. cable runs I_{max} in the input circuit:

$$I_{max} = \frac{R_{Imax}}{R_I / km}$$

R_{Imax} = max. overall cable resistance (see technical details)
R_I / km = cable resistance/km

- Use copper wire that can withstand 60/75 °C.
- Sufficient fuse protection must be provided on all output contacts with capacitive and inductive loads.
- With U_B 48 – 240 VAC/DC: Connect S21 to the protective earth system

Terminal configuration

Installation

Install base unit without contact expander module:
▸ Ensure that the plug terminator is inserted at the side of the unit.
Connect base unit and PNOZsigma contact expander module:
▸ Remove the plug terminator at the side of the base unit and at the contact expander module.
▸ Connect the base unit and the contact expander module to the supplied connector before mounting the units to the DIN rail.

Installation in control cabinet
▸ The safety relay should be installed in a control cabinet with a protection type of at least IP54.
▸ Use the notch on the rear of the unit to attach it to a DIN rail (35 mm).
▸ When installed vertically: Secure the unit by using a fixing element (e.g. retaining brakket or end angle).
▸ Push the unit upwards or downwards before lifting it from the DIN rail.

Dimensions
*with spring-loaded terminals

Up to PL e of EN ISO 13849-1
PNOZ s5

Notice

This data sheet is only intended for use during configuration. For installation and operation, please refer to the operating instructions supplied with the unit.

Service life graph

The service life graphs indicate the number of cycles from which failures due to wear must be expected. The wear is mainly caused by the electrical load; the mechanical load is negligible.

▶ D	Schaltspielzahl x 10^3	▶ E Número de ciclos x 10^3
▶ GB	Cycles x 10^3	▶ I Numero dei cicli di commutazione x 10^3
▶ F	Nombre de manœuvres x 10^3	▶ NL Aantal schakelingen x 10^3

Example

▸ Inductive load: 0.2 A
▸ Utilisation category: AC15
▸ Contact service life: 700 000 cycles
Provided the application requires fewer than 700 000 cycles, the PFH value (see technical details) can be used in the calculation.
To increase the service life, sufficient spark suppression must be provided on all output contacts. With capacitive loads, any power surges that occur must be noted. With contactors, use freewheel diodes for spark suppression.
We recommend you use semiconductor outputs to switch 24 VDC loads.

Weight	**235 g** No. 750105, 751105, 751185
	280 g No. 750135, 751135

No. stands for order number.

It is essential to consider the relay's service life graphs. The relay outputs' safety-related characteristic data is only valid if the values in the service life graphs are met.

The PFH value depends on the switching frequency and the load on the relay output.
If the service life graphs are not accessible, the stated PFH value can be used irrespective of the switching frequency and the load, as the PFH value already considers the relay's B10d value as well as the failure rates of the other components.

All the units used within a safety function must be considered when calculating the safety characteristic data.

The standards current on **2006-04** apply.

Conventional thermal current
