# Validity of Application Note

This present Application Note is valid until a new version of the document is published. This and other Application Notes can be downloaded in the latest version and for free from <u>www.pilz.com</u>.

For a simple search, use our <u>content document (1002400)</u> or the <u>direct search function</u> in the download area.

# **Exclusion of liability**

We have taken great care in compiling our application note. It contains information about our company and our products. All statements are made in accordance with the current status of technology and to the best of our knowledge and belief.

However, we cannot accept liability for the accuracy and entirety of the information provided, except in the case of gross negligence. In particular it should be noted that statements do not have the legal quality of assurances or assured properties.

We are grateful for any feedback on the contents.

March 2016

All rights to this publication are reserved by Pilz GmbH & Co. KG. We reserve the right to amend specifications without prior notice. Copies may be made for the user's internal purposes. The names of products, goods and technologies used in this manual are trademarks of the respective companies.

Fig. 1: Hardware configuration

# 3. Application Task

# 3.1. Description

The example shows the implementation of an emergency stop application with a PSS 4000 PLC.

The safe control and evaluation of the signals is taken over by two Pilz Function blocks (FS-FB) from the library.

- FS\_EmergencyStop
   CRC EA57
- FS\_OutputFBL
  - CRC B3A7

The workflow is divided into the following two main functions:

- Emergency Stop and
- Feedback Loop Monitoring

# 3.1.1. Emergency stop function

The control system monitors the emergency stop button (S1) via the user program. An instance of the Pilz Function block "*FS\_EmergencyStop*" is assigned to them. This FS-FB detects whether the assigned emergency stop button has been operated, as well as detecting incorrect input signals and whether the contact synchronization time has been exceeded, etc.

If the emergency stop button (S1) is operated or an error occurs, the enable output "Enable" on the FS-FB will immediately be reset.

The enable output "Enable" is also reset when the PSS is stopped and when the PSS is switched on. The signal from the enable output "Enable" must be evaluated by the user program and trigger an appropriate reaction.

Based on the diagnostic outputs ("*DiagSwitchError*", "*DiagInputNotValid*") it can be determined why "Enable" was reset.

The outputs "*DiagOperated*", "*DiagReadyForReset*" and "*DiagReadyForTest*" are used as status messages.

A "valid bit" is formed by the system for the respective hardware input to determine whether a process value received from a sensor is valid.

The valid bit is queried in the Function block and indicates whether an error has occurred in the signal transmission between hardware input and processor (such as test clock error, module overheats, etc.).

If the valid bit is FALSE, the process value is invalid and the Pilz function block provides an appropriate diagnostic message. The error signal reset enable.

(For more information, see "Validity of process data" in PAS4000 online help)

The way in which the error is reset will depend on the operating mode set on the FS-FB. In this application example, parameters for FS-FB have been set in such a way that "Reset" (S3) is required in order to reset output parameter "Enable" when:

- the PSS is cold started (PSS switched from off to on),
- warm started (PSS transferring from STOP to RUN) or
- when the emergency stop button (S1) is released.

Although the emergency stop functions are configured to reset themselves, a PSS cold start or the release of an emergency stop button that has been operated may not directly enable a machine to start up without further conditions being met.

#### Input circuit safety assessment

- If a contact on the emergency stop button is overridden, the Pilz function block will detect this as an error at the next operation.
- A short between the input circuits within a multicore cable will be detected as an error by the programmable control system.
- A short between 24 VDC and an input circuit will be detected as an error by the programmable control system.
- The highest category can only be achieved when the contacts on the E-STOP pushbutton are supplied with test pulses and the E-STOP pushbutton has dual-channel wiring.
- If an operator completely (or even maybe partly) is able to access the dangerous area, a risk analysis should clarify whether an additional, separate "manual reset function" is required.

#### Switch-off delay of the emergency stop enable signal

The enable output "Enable" of the Pilz Function block "*FS\_EmergencyStop*" is passed by means of the Function block "TOF" switch-off-delayed to the Pilz function block "*FS\_OutputFBL*" This allows the controlled switch-off of the motor before the safe isolation of the motor contactor is activated. The shutdown delay must be considered at the risk assessment.

### 3.1.2. Feedback loop monitoring function

The control system monitors the feedback circuits (NC contacts) of the motor contactors KM1 and KM2 via the user program.

An instance of the Pilz function block "*FS\_OutputFBL*" is assigned to them.

The FS-FB drives the contactors as well as monitoring the feedback loop.

A 1-signal at input parameter "Input" (delayed "Enable" of emergency stop) of the FS-FB sets the outputs that drive the contactors,

"Output1" and "Output2", to "1"; a 0-signal sets it to "0".

If an error occurs, the outputs "Output1" and "Output2" that drive the contactors on FS-FB will immediately be reset. Both outputs are also reset when the PSS is stopped and when the PSS is switched on.

Based on the diagnostic outputs ("*DiagFeedbackLoopError*", "*DiagFeedbackLoopNotValid*") it can be determined why the outputs were reset.

A "valid bit" is formed by the system for the respective hardware input to determine whether a process value received from a sensor is valid.

The valid bit is queried in the Function block and indicates whether an error has occurred in the signal transmission between hardware input and processor (such as test clock error, module overheats, etc.).

If the valid bit is FALSE, the process value is invalid and the Pilz function block provides an appropriate diagnostic message. The error signal reset enable.

(For more information, see "Validity of process data" in PAS4000 online help)

If an error occurs, a new activity has to take place at the input "Input" of the FS-FB once the error has been rectified, so that the outputs "*Output1*" and "*Output2*" will be set again.

#### Feedback loop monitoring safety assessment

- A short between 24 VDC and a safety output or a feedback loop input will be detected as an error by the programmable control system. The load can be switched off via the second shutdown route.
- > The feedback loop contacts must be installed in a single mounting area (control cabinet).
- > To achieve a higher level of safety, 2 actuators must be used.

# 3.2. Function Safety

### 3.2.1. Safety-related characteristics in accordance with EN ISO 13849-1

No.	Safety function	PL	Safety-related parts of the control system
1	Machine shut down via E-STOP	PL e	Sensor (PITesop S1)
			Input (PSSu E F 4DI)
			Logic (PSSu H PLC1 FS SN)
			Output (PSSu E F DI OZ 2)
			Actuator (contactors KM1, KM2)

### Prerequisites

No.	Description		Identification
1	Common cause failure (CCF)		Requirements are considered to be met
			(must be tested on implementation)
2	Mission time		20 years
3	Operating interval (electromechanical	Sensor	one operations per week
	components)	Actuator	one operations per week
4	Characteristic data of contactors KM1/KM2	B10 <sub>D</sub>	1,300,000

Please note the further requirements of EN ISO 13849-1, e.g. requirements for avoiding systematic faults.

No.	Safety-related control function (SRCF)	Safety Integrity	Subsystems
		Level	
1	Machine shut down via E-STOP	SIL 3	Sensor (PITesop S1)
			Input (PSSu E F 4DI)
			Logic (PSSu H PLC1 FS SN)
			Output (PSSu E F DI OZ 2)
			Actuator (contactors KM1, KM2)

3.2.2. Safety-related characteristics in accordance with EN 62061

### Prerequisites

No.	Description		Identification
1	Common cause failure (CCF)		$\beta = 2\%$ (must be tested on
			implementation)
2	Proof test interval		20 years
3	Operating interval (electromechanical	Sensor	one operations per week
	components)	Actuator	one operations per week
4	Characteristic data of contactors KM1/KM2	B10 <sub>D</sub>	1,300,000
		Dangerous	75%
		failure rate	

Please note the further requirements of EN 62061, e.g. requirements for systematic safety integrity.

### 3.3. PAS-Project

To operate a plant with one or more programmable control systems PSS 4000, a project must be created in PAS4000.

A project consists of the hardware configuration and the user program.

# 3.3.1. IEC 61131 Programming

When programming in accordance with IEC 61131, the user program is structured by three types of program organisation units (POUs):

- Programs (PRG)
- Function blocks (FB)
- Functions (FUN)

The program forms the higher structural level. Functions and function blocks may be called up within a program.

Function blocks and functions undertake specific individual tasks within the program.

Each POU consists of a declaration part and an instruction part.

The variables and type declarations are made in the declaration part, which is shown in text format, irrespective of the programming language.

The instruction part contains the instructions. The instructions can be formulated in one of the IEC 61131 programming languages.

(For more information about programming with PAS4000, look at PAS4000 online help)

# 3.3.1.1. LD-Editor

The program for the cyclic process is created in a POU of the type "Program". The Pilz function blocks for emergency stop and feedback loop were added from the library in the declaration part of the program. (Right-click in the declaration part of the POU "Add Library Element").

### Instruction part

Fig. 7: Instruction part

### **Standard Program**

The signals from the start- and stop switch are imported from a standard module PSSu E S 4DI (1A4). These signals belong to the motor control and thus to the standard control functions of the machine.

The program code for the evaluation and processing of these signals is not processed within the FS resource (safety-related part) of the control, but in a ST resource in a separate task as independent application (additional POU of type program).

### 3.3.2. I/O Mapping

In PAS4000, variables can be created and the user program can be programmed without the need of the mapping to the hardware being present at the beginning of the project.

After identification of the used I/O from the variable declaration, the required hardware can be determined.

The I/O mapping editor forms the connecting between the user program and the hardware and coordinates the available I/O and existing PI-variables.

# 3.3.2.1. I/O Mapping Editor

The PI variables declared in the user-program can be assigned in the I/O mapping editor to the hardware configuration.

#### 3.3.3. Resource Assignment

The resource assignment defines which section of the user program is to be executed on which resource and in which task. The tasks determine the run-time properties of sections of the user program, i.e. the priority with which they are executed.

You can assign the programs automatically to task by drag and drop, then modify the task settings, or create the tasks first and then assign the programs separately.

#### 3.3.4. Process PAS Project

Step 1: In the LD editor, PI variables and the logical sequence will be generated as a program.

Fig. 11: PI variables

Step 2: The design of the hardware (control, I/O, sensor, actor) will be created as a circuit diagram. (parallel possible to Step 1)

Fig. 12: Circuit diagram (extract)

Step 3: Based on the PI variable (I/O), the required power of control (PLC, Multi) is selected. The implantation of the I/O modules in the PAS system occurs in the PSSu module editor.

Fig. 13: PSSu Module Editor

Step 4: Assignment of the PI variables in the I/O Mapping Editor.

Fig. 14: I/O Mapping Editor

PILZ The spirit of safety

Pilz develops environmentally-friendly products using ecological materials and energy-saving technologies. Offices and production facilities are ecologically designed, environmentally-aware and energy-saving. So Pilz offers sustainability, plus the security of using energy-efficient products and environmentally-friendly solutions.
