Introduction

Validity of documentation

This documentation is valid for the product PNOZ X2.7P. It is valid until new documentation is published.

This operating manual explains the function and operation, describes the installation and provides guidelines on how to connect the product.

Using the documentation

This document is intended for instruction. Only install and commission the product if you have read and understood this document. The document should be retained for future reference.

Definition of symbols

Information that is particularly important is identified as follows:

DANGER!

This warning must be heeded! It warns of a hazardous situation that poses an immediate threat of serious injury and death and indicates preventive measures that can be taken.

WARNING!

This warning must be heeded! It warns of a hazardous situation that could lead to serious injury and death and indicates preventive measures that can be taken.

CAUTION!

This refers to a hazard that can lead to a less serious or minor injury plus material damage, and also provides information on preventive measures that can be taken.

NOTICE

This describes a situation in which the product or devices could be damaged and also provides information on preventive measures that can be taken. It also highlights areas within the text that are of particular importance.

PNOZ X2.7P

INFORMATION

This gives advice on applications and provides information on special features

Safety

Intended use

The safety relay PNOZ X2.7P provides a safety-related interruption of a safety circuit.

The safety relay meets the requirements of EN 60947-5-1, EN 60204-1 and VDE 0113-1 and may be used in applications with

- ▶ E-STOP pushbuttons
- Safety gates
- Light grids and safety switches with detection of shorts across contacts

The following is deemed improper use in particular:

- Any component, technical or electrical modification to the product
- Use of the product outside the areas described in this manual
- Use of the product outside the technical details (see Technical details [44] 17]).

NOTICE

EMC-compliant electrical installation

The product is designed for use in an industrial environment. The product may cause interference if installed in other environments. If installed in other environments, measures should be taken to comply with the applicable standards and directives for the respective installation site with regard to interference.

Safety regulations

Safety assessment

Before using a unit it is necessary to perform a safety assessment in accordance with the Machinery Directive.

Functional safety is guaranteed for the product as a single component. However, this does not guarantee the functional safety of the overall plant/machine. In order to achieve the required safety level for the overall plant/machine, define the safety requirements for the plant/machine and then define how these must be implemented from a technical and organisational standpoint.

Use of qualified personnel

The products may only be assembled, installed, programmed, commissioned, operated, maintained and decommissioned by competent persons.

A competent person is someone who, because of their training, experience and current professional activity, has the specialist knowledge required to test, assess and operate the work equipment, devices, systems, plant and machinery in accordance with the general standards and guidelines for safety technology.

It is the company's responsibility only to employ personnel who:

- Are familiar with the basic regulations concerning health and safety / accident prevention
- Have read and understood the information provided in this description under "Safety"
- And have a good knowledge of the generic and specialist standards applicable to the specific application.

Warranty and liability

All claims to warranty and liability will be rendered invalid if

- > The product was used contrary to the purpose for which it is intended
- Damage can be attributed to not having followed the guidelines in the manual
- Operating personnel are not suitably qualified
- Any type of modification has been made (e.g. exchanging components on the PCB boards, soldering work etc.).

Disposal

- In safety-related applications, please comply with the mission time T_M in the safety-related characteristic data.
- When decommissioning, please comply with local regulations regarding the disposal of electronic devices (e.g. Electrical and Electronic Equipment Act).

For your safety

The unit meets all the necessary conditions for safe operation. However, please note the following:

Note for overvoltage category III: If voltages higher than low voltage (>50 VAC or >120 VDC) are present on the unit, connected control elements and sensors must have a rated insulation voltage of at least 250 V.

Unit features

- Positive-guided relay outputs:
 - 3 safety contacts (N/O), instantaneous
 - 1 auxiliary contact (N/C), instantaneous
- Connection options for:
 - E-STOP pushbuttons
 - Safety gate limit switches
 - Start button
 - Light guards and safety switches
- LED display for:
 - Supply voltage
 - Switch status of the safety contacts
- Plug-in connection terminals (either spring-loaded terminal or screw terminal)
- See order reference for unit types

Safety features

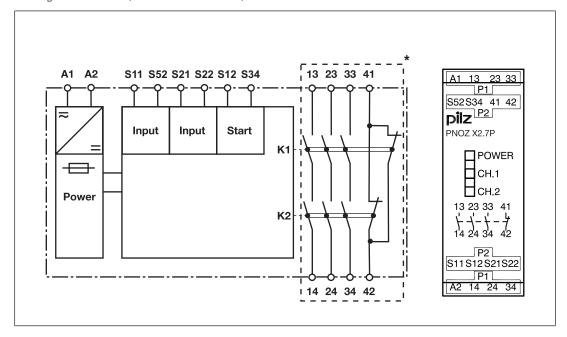

The safety relay meets the following safety requirements:

- The circuit is redundant with built-in self-monitoring.
- ▶ The safety function remains effective in the case of a component failure.
- The correct opening and closing of the safety function relays is tested automatically in each on-off cycle.

Block diagram/terminal configuration

Type: 24 VAC/DC

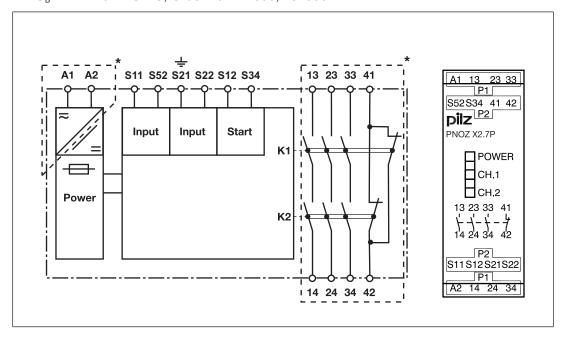

▶ U_B: 24 VAC/DC; Order no. 777305, 787305

^{*}Insulation between the non-marked area and the relay contacts: Basic insulation (over-voltage category III), Protective separation (overvoltage category II)

Type: 24 - 240 V AC/DC

U_B: 24 − 240 VAC/DC; Order no. 777306, 787306

^{*}Insulation between the non-marked area and the relay contacts: Basic insulation (over-voltage category III), Protective separation (overvoltage category II)

Function Description

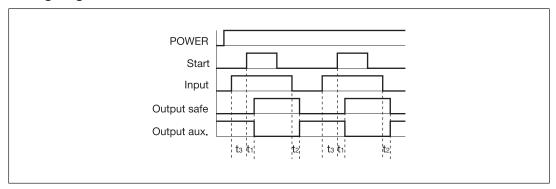

The safety relay PNOZ X2.7P provides a safety-oriented interruption of a safety circuit. When supply voltage is supplied the "POWER" LED is lit. The unit is ready for operation when the start circuit S12-S34 is closed.

- Input circuit is closed (e.g. E-STOP pushbutton not operated):
 - LEDs "CH1" and "CH2" will light.
 - Safety contacts 13-14, 23-24 and 33-34 are closed, auxiliary contact 41-42 is open.
 The unit is active.
- Input circuit is opened (e.g. E-STOP pushbutton operated):
 - The LEDs "CH1" and "CH2" go out.
 - Safety contacts 13-14, 23-24 and 33-34 are opened redundantly, auxiliary contact 41-42 is closed.

Operating modes

- Single-channel operation: No redundancy in the input circuit, earth faults in the start and input circuit are detected.
- Dual-channel operation without detection of shorts across contacts: Redundant input circuit, detects PNOZ X2.7P
 - earth faults in the start and input circuit,
 - short circuits in the input circuit.
- Dual-channel operation with detection of shorts across contacts: Redundant input circuit, PNOZ X2.7P detects
 - earth faults in the start and input circuit,
 - short circuits in the input circuit,
 - shorts across contacts in the input circuit.
- Monitored start: Unit is active once the input circuit is closed and once the start circuit is closed after the waiting period has elapsed (see Technical details [44 17]).
- Increase in the number of available contacts by connecting contact expander modules or external contactors/relays.

Timing diagram

Legend

Power: Supply voltage

Start: Start circuit

Input: Input circuit

Output safe: Safety contacts

Output aux: Auxiliary contact

t₁: Switch-on delay

▶ t₂: Delay-on de-energisation

→ t₃: Waiting period

Installation

- The unit should be installed in a control cabinet with a protection type of at least IP54.
- Use the notch on the rear of the unit to attach it to a DIN rail.
- Ensure the unit is mounted securely on a vertical DIN rail (35 mm) by using a fixing element (e.g. retaining bracket or an end angle).

Wiring

Please note:

- Information given in the "Technical details [17]" must be followed.
- Outputs 13-14, 23-24, 33-34 are safety contacts; output 41-42 is an auxiliary contact (e.g. for display).
- Auxiliary contact 41-42 should **not** be used for safety circuits!
- To prevent contact welding, a fuse should be connected before the output contacts (see Technical details [44]).
- Calculation of the max. cable runs I_{max} in the input circuit:

$$I_{max} = \frac{R_{lmax}}{R_l / km}$$

 R_{lmax} = max. overall cable resistance (see Technical details [17]) R_{l} / km = cable resistance/km

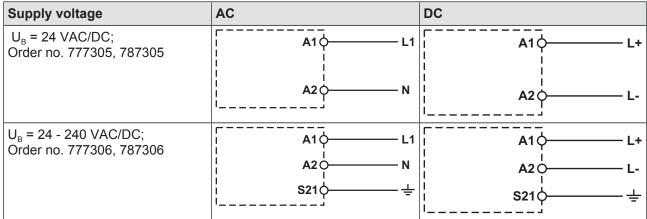

- Use copper wire that can withstand 60/75 °C.
- Sufficient fuse protection must be provided on all output contacts with capacitive and inductive loads.
- Do not switch low currents using contacts that have been used previously with high currents
- When connecting magnetically operated, reed proximity switches, ensure that the max. peak inrush current (on the input circuit) does not overload the proximity switch.
- On 24 VAC/DC units: The power supply must comply with the regulations for extra low voltages with safe electrical separation (SELV, PELV) in accordance with VDE 0100, Part 410.
- Ensure the wiring and EMC requirements of IEC 60204-1 are met.

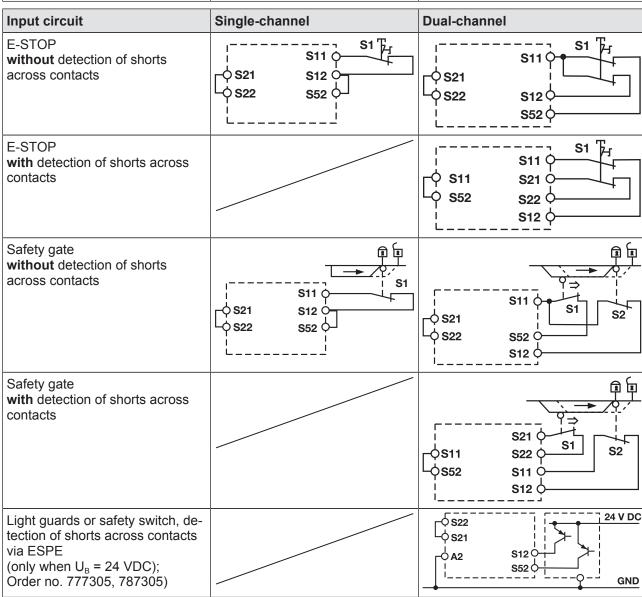

Important for detection of shorts across contacts:

As this function for detecting shorts across contacts is not failsafe, it is tested by Pilz during the final control check. If there is a danger of exceeding the cable runs, we recommend the following test after the installation of the device:

- 1. Unit ready for operation (output contacts closed)
- 2. Short circuit the test terminals S12, S22 for detecting shorts across the inputs.
- 3. The unit's fuse must be triggered and the output contacts must open. Cable lengths in the scale of the maximum length can delay the fuse triggering for up to 2 minutes.
- Reset the fuse: remove the short circuit and switch off the supply voltage for approx. 1 minute.

Preparing for operation

NOTICE

With single-channel wiring the safety level of your machine/plant may be lower than the safety level of the unit (see Safety characteristic data [26]).

NOTICE

Operation with a light guard or safety switch

It must not be possible to switch off the supply voltage for the PNOZ X2.7P separately from the supply voltage for the light guard or safety switch.

| Start circuit | Single-channel | Dual-channel |
|-----------------|----------------|--------------|
| Monitored start | S12 \$ S3 | S12 0 S3 |

| Feedback loop | Automatic start | Monitored start |

- S3: Reset button
- → : Switch operated
- Gate open
- Gate closed

Operation

NOTICE

Check each safety function

- after initial commissioning and after each change of the machine/ plant
- for SIL CL 3/PL e at least 1x per month, for SIL CL 2/PL d at least 1x per year

Follow the instructions below:

- Activate the safety function and check whether all the used safety contacts open.
- Prepare for operation again and start the unit. All the used safety contacts must be closed again.

The safety functions may only be checked by qualified personnel.

Status indicators

LEDs indicate the status and errors during operation:

LED on

POWER

Supply voltage is present.

CH.1

Safety contacts of channel 1 are closed.

CH.2

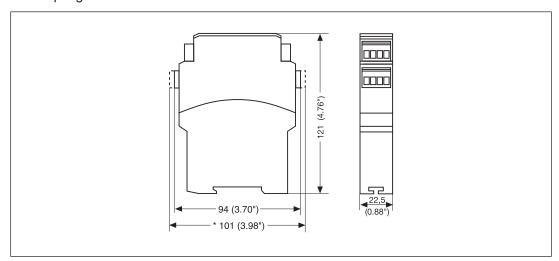

Safety contacts of channel 2 are closed.

Faults - Interference

- Earth fault: The supply voltage fails and the safety contacts open. Once the cause of the respective fault has been rectified and the supply voltage is switched off for approx. 1 minute, the unit is ready for operation again.
- Contact malfunctions: If the contacts have welded, reactivation will not be possible after the input circuit has opened.
- ▶ LED "POWER" does not light: Short circuit or no supply voltage.

Safety characteristic data

NOTICE

You must comply with the safety-related characteristic data in order to achieve the required safety level for your plant/machine.

| Operating mode | EN ISO 13849-1: 2008 | EN ISO 13849-1: 2008 | EN 62061 SIL CL | EN 62061 PFH _D [1/h] | IEC 61511 SIL | IEC 61511 PFD | EN ISO 13849-1: 2008 |
|----------------|----------------------------|----------------------------|--------------------|------------------------------------|------------------|------------------|----------------------------|
| | PL | Category | | | | | T _м [year] |
| _ | PL e | Cat. 4 | SIL CL 3 | 2,31E-09 | SIL 3 | 2,03E-06 | 20 |

All the units used within a safety function must be considered when calculating the safety characteristic data.

INFORMATION

A safety function's SIL/PL values are **not** identical to the SIL/PL values of the units that are used and may be different. We recommend that you use the PAScal software tool to calculate the safety function's SIL/PL values.

Supplementary data

CAUTION!

It is essential to consider the relay's service life graphs. The relay outputs' safety-related characteristic data is only valid if the values in the service life graphs are met.

The PFH value depends on the switching frequency and the load on the relay output. If the service life graphs are not accessible, the stated PFH value can be used irrespective of the switching frequency and the load, as the PFH value already considers the relay's B10d value as well as the failure rates of the other components.

Service life graph

The service life graphs indicate the number of cycles from which failures due to wear must be expected. The wear is mainly caused by the electrical load; the mechanical load is negligible.

Unit types with UB 24 VAC/DC

U_B: 24 VAC/DC; Order no. 777305, 787305

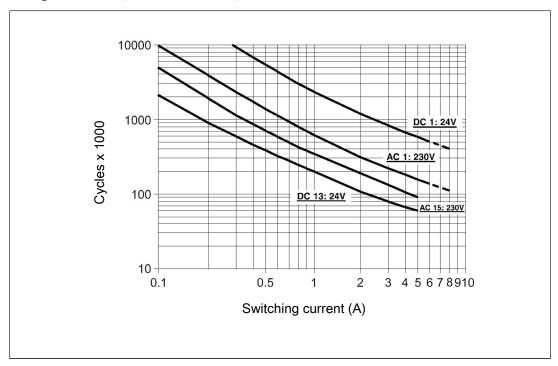

Fig.: Service life graphs at 24 V DC and 230 V AC

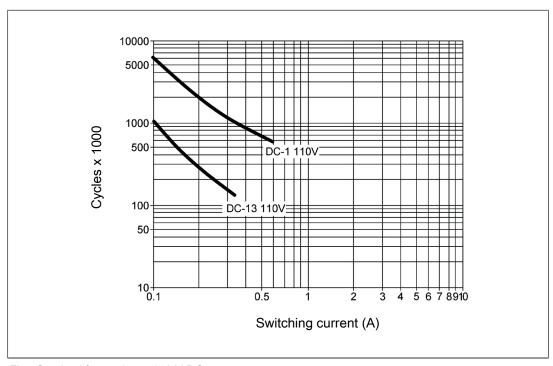

Fig.: Service life graphs at 110 V DC

Example

Inductive load: 0.2 A

Utilisation category: AC15

Contact service life: 2 000 000 cycles

Provided the application to be implemented requires fewer than 2 000 000 cycles, the PFH value (see Technical details [17]) can be used in the calculation.

To increase the service life, sufficient spark suppression must be provided on all output contacts. With capacitive loads, any power surges that occur must be noted. With DC contactors, use flywheel diodes for spark suppression.

Unit types with UB 24-240 VAC/DC

► U_B: 24 – 240 VAC/DC; Order no. 777306, 787306

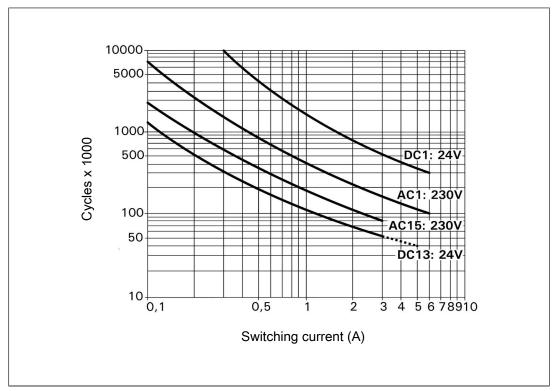

Fig.: Service life graphs at 24 V DC and 230 V AC

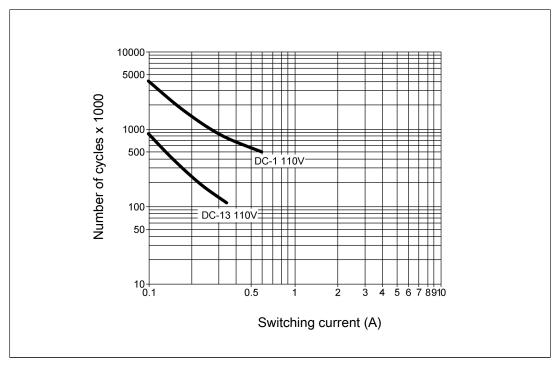

Fig.: Service life graphs at 110 V DC

Example

Inductive load: 0.2 A

Utilisation category: AC15

Contact service life: 1 000 000 cycles

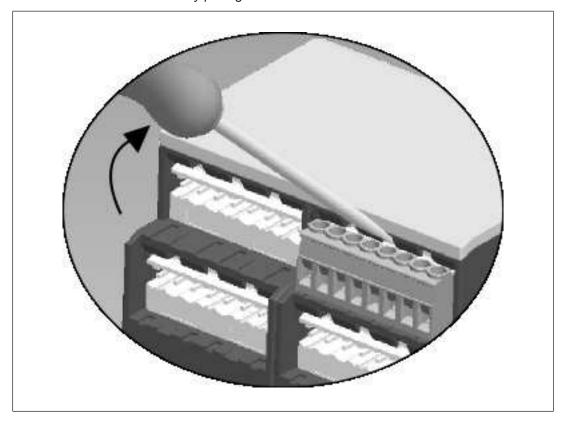

Provided the application to be implemented requires fewer than 1 000 000 cycles, the PFH value (see Technical details [17]) can be used in the calculation.

To increase the service life, sufficient spark suppression must be provided on all relay contacts. With capacitive loads, any power surges that occur must be noted. With DC contactors, use flywheel diodes for spark suppression.

Remove plug-in terminals

Procedure: Insert the screwdriver into the housing recess behind the terminal and lever the terminal out.

Do not remove the terminals by pulling the cables!
