Introduction

Validity of documentation

This documentation is valid for the product PSEN cs2.1n. It is valid until new documentation is published.

This operating manual explains the function and operation, describes the installation and provides guidelines on how to connect the product.

Using the documentation

This document is intended for instruction. Only install and commission the product if you have read and understood this document. The document should be retained for future reference.

Definition of symbols

Information that is particularly important is identified as follows:

DANGER!

This warning must be heeded! It warns of a hazardous situation that poses an immediate threat of serious injury and death and indicates preventive measures that can be taken.

WARNING!

This warning must be heeded! It warns of a hazardous situation that could lead to serious injury and death and indicates preventive measures that can be taken.

CAUTION!

This refers to a hazard that can lead to a less serious or minor injury plus material damage, and also provides information on preventive measures that can be taken.

NOTICE

This describes a situation in which the product or devices could be damaged and also provides information on preventive measures that can be taken. It also highlights areas within the text that are of particular importance.

INFORMATION

This gives advice on applications and provides information on special features.

Safety

Intended use

The safety functions of the safety switch are:

- Safe shutdown of safety outputs when the actuator is removed beyond the assured release distance s_{ar} or when the actuator is not detected
- Remain shut down safely after the actuator has been removed

The safety switch meets the requirements in accordance with:

- ▶ EN 60947-5-3: PDDB with the actuator PSEN cs2.1
- EN 62061: SIL CL 3
- EN ISO 13849-1: PL e (Cat. 4)
- ▶ EN ISO 14119: Coding level High, type 4

The safety switch may only be used with the corresponding actuator PSEN cs2.1.

The safety level PL e (Cat. 4)/SIL CL 3 is only achieved if

▶ the safety outputs use 2-channel processing.

Improper use

The following is deemed improper use in particular

- > Any component, technical or electrical modification to the product,
- > Use of the product outside the areas described in this operating manual,
- ▶ Use of the product outside the technical details (see Technical details [^[] 16]).

NOTICE

EMC-compliant electrical installation

The product is designed for use in an industrial environment. The product may cause interference if installed in other environments. If installed in other environments, measures should be taken to comply with the applicable standards and directives for the respective installation site with regard to interference.

Safety regulations

Safety assessment

Before using a device, a safety assessment in accordance with the Machinery Directive is required.

The product as an individual component fulfils the functional safety requirements in accordance with EN ISO 13849 and EN 62061. However, this does not guarantee the functional safety of the overall plant/machine. To achieve the relevant safety level of the overall plant/ machine's required safety functions, each safety function needs to be considered separately.

Use of qualified personnel

The products may only be assembled, installed, programmed, commissioned, operated, maintained and decommissioned by persons who are competent to do so.

A competent person is a qualified and knowledgeable person who, because of their training, experience and current professional activity, has the specialist knowledge required. To be able to inspect, assess and operate devices, systems and machines, the person has to be informed of the state of the art and the applicable national, European and international laws, directives and standards.

It is the company's responsibility only to employ personnel who

- > Are familiar with the basic regulations concerning health and safety / accident prevention,
- Have read and understood the information provided in the section entitled Safety
- Have a good knowledge of the generic and specialist standards applicable to the specific application.

Warranty and liability

All claims to warranty and liability will be rendered invalid if

- > The product was used contrary to the purpose for which it is intended,
- > Damage can be attributed to not having followed the guidelines in the manual,
- > Operating personnel are not suitably qualified,
- Any type of modification has been made (e.g. exchanging components on the PCB boards, soldering work etc.).

Disposal

- ▶ In safety-related applications, please comply with the mission time T_M in the safety-related characteristic data.
- When decommissioning, please comply with local regulations regarding the disposal of electronic devices (e.g. Electrical and Electronic Equipment Act).

For your safety

WARNING!

Loss of safety function due to manipulation of the interlocking device

Manipulation of the interlocking device may lead to serious injury and death.

- You should prevent any possibility of the interlocking device being manipulated through the use of a spare actuator.
- Keep the substitute actuator in a safe place and protect it from unauthorised access.
- If substitute actuators are used, these must be installed as described under Installation [1] 13].
- If the original actuators are replaced with substitute actuators, the original actuators must be destroyed before disposal.
- Do not remove the connector's protective cap until you are just about to connect the unit. This will prevent potential contamination.

Unit features

- Transponder technology for presence detection
- Pilz coding type: fully coded
- Dual-channel operation
- 2 safety outputs
- LED display for:
 - State of the actuator
 - State of the inputs
 - Supply voltage/fault
- 4 directions of actuation

Function description

The safety outputs may have a high or low signal, depending on the position of the actuator.

In a safe condition the safety outputs are in the OFF state.

State of the outputs:

Actuator in the response range	Safety output 12	Safety output 22
Yes	High	High
No	Low	Low

Block diagram

Operating distances

Legend:

- ▶ S_{ao} Assured operating distance: 15 mm
- ▶ S₀ Typical operating distance: 21 mm
- S_r Typical release distance: 32 mm
- ▶ S_{ar} Assured release distance: 40 mm

Lateral and vertical offset

Legend

- [1] Hysteresis
- [2] Typical operating distance S_o
- [3] Typical release distance S_r
- [4] Offset in mm
- [5] Operating distance in mm
- [6] Response range

Wiring

Please note:

- Information given in the "Technical details" must be followed.
- Switch off the supply voltage before disconnecting the plug-in connection.
- Make sure that when connecting or separating the connector the pollution degree 1 or 2 is maintained.
- The power supply must meet the regulations for extra low voltages with protective electrical separation (SELV, PELV).
- The outputs of the safety switch must have a protective separation to voltages over 60 V AC.
- The supply voltage to the safety switch must be protected with a 2 A to 4 A quick-acting fuse.
- ▶ Ensure the wiring and EMC requirements of EN 60204-1 are met.

Pin assignment, connector and cable

		5-pin M12 male connector	
PIN	Pin designation	Function	Wire colour
1	A1	+24 UB	Brown

2	12	Output, channel1	White
3	A2	0 V UB	Blue
4	22	Output, channel2	Black
5	-	Do not connect	Grey

The wire colour also applies for the cable available from Pilz as an accessory.

Connection to evaluation devices

Make sure that the selected evaluation device has the following property:

OSSD signals are evaluated through 2 channels with plausibility monitoring Note:

▶ Information given in the Technical details [□ 16] must be followed.

Connection diagram, single connection

Suitable Pilz evaluation devices are, for example:

- PNOZelog for safety gate monitoring
- PNOZpower for safety gate monitoring
- PNOZsigma for safety gate monitoring
- PNOZ X for safety gate monitoring
- PNOZmulti for safety gate monitoring Configure the switch in the PNOZmulti Configurator with switch type 3.
- PSS for safety gate monitoring with standard function block SB064, SB066 or FS_Safety Gate
- PSSuniversal PLC for safety gate monitoring with function block FS_SafetyGate

The correct connection to the respective evaluation device is described in the operating manual for the evaluation device. Make sure that the connection is made in accordance with the specifications in the operating manual for the selected evaluation device.

The connections to two evaluation devices are shown on the following pages, by way of example:

- PNOZ s3 and
- PNOZmulti

PNOZ s3

PNOZmulti

Teaching in the actuator

Teaching in the actuator for the first time:

The first actuator to be detected by the safety switch (see Intended use [4] 6]) is taught in automatically as soon as it is brought into the response range.

To teach in a new actuator:

A maximum of 8 learning procedures are possible.

- The actuator that is to be taught in must be brought into the safety switch's response range as the only transponder. As soon as the actuator is detected, the "Safety Gate" LED will flash yellow.
- 2. After 20 s has elapsed, the "Safety Gate" LED turns to quick yellow flashes. Trigger a system reset in the next 120 s by interrupting the power supply.
- 3. When the supply voltage is switched back on, the learning procedure is complete and the number of permitted additional learning procedures is reduced by 1.

NOTICE

- The actuator must not be removed during the learning procedure.
- It is no loner possible to reteach his actuator on the same safety switch.

Installation

CAUTION!

Potential loss of safety function due to changed device properties

The unit's properties may be affected if installed in an environment containing electrically or magnetically conductive material.

- Please check the operating distances and the assured release distance.
- > The safety switch and actuator should be installed opposite each other in parallel.
 - Make sure that the actuator is aligned to the marking on the sensor that guarantees the operating distance required by the plant design (see Operating distances [29]).
- Safety switches and actuators should be permanently secured using M5 safety screws with a flat head (e.g. M5 cheese-head or pan head screws).
- Protect the actuator from contamination.
- ▶ Torque setting: Please note the information provided under Technical details [44] 16].
- The distance between two safety switches must be maintained (see Technical details [12] 16]).
- Make sure that the safety switch and actuator cannot be used as an end stop.
- Please note the installation measures in accordance with EN ISO 14119 for a safety switch design 4 and with level of coding High.

- ▹ For simpler installation, the mounting brackets (see Order reference for Accessories [□ 21]) can be used.
- If using angled connector plugs, note the defined angle of the cable routing.

CAUTION!

Possible loss of the safety function by changing the release distance $S_{\mbox{\scriptsize ar}}$ with non-flush installation

Installing the safety switch non-flush within electrically or magnetically conductive material, the value for the assured release distance \mathbf{S}_{ar} can change.

- Check the assured release distance Sar.

Procedure:

Fig.: Sensing faces on the sensor

- 1. Drill holes (for M5 screws) in the mounting surface to secure the actuator and sensor (see Dimensions in mm [16]).
- 2. Use a screw to fix the sensor to the mounting surface.

Make sure that the sensor marking that is be used for operation can be operated using the actuator from the right side.

- 3. Do not fully tighten the second screw on the safety switch.
- 4. Use a screw to fix the actuator to the mounting surface.

Make sure that the actuator with the printed side points towards the marking on the sensor.

- 5. Do not fully tighten the second screw on the actuator.
- 6. Align the safety switch and tighten the screws.
- 7. Align the actuator and tighten the screws.

Adjustment

- ▶ The stated operating distances (see Technical details [□ 16]) only apply when the safety switch and actuator are installed facing each other in parallel. Operating distances may deviate if other arrangements are used.
- ▶ Note the maximum permitted lateral and vertical offset (see Operating distances [□ 9] and Lateral and vertical offset [□ 10]).

Operation

NOTICE

The safety function should be checked after initial commissioning and each time the plant/machine is changed. The safety functions may only be checked by qualified personnel.

Check the function of the safety switch before commissioning.

Status indicators:

- > "POWER/Fault" LED lights up green: The unit is ready for operation
- > "Safety Gate" LED lights up yellow: Actuator is within the response range

Fault indicator:

"POWER/Fault" LED lights up red: Error message.

Remedy: Rectify fault and interrupt power supply.

Safety characteristic data

NOTICE

You must comply with the safety characteristic data in order to achieve the required safety level for your plant/machine.

Operating mode	EN ISO 13849-1: 2015	EN ISO 13849-1: 2015	EN 62061 SIL CL	EN 62061 PFH _D [1/h]	IEC 61511 SIL	IEC 61511 PFD	EN ISO 13849-1: 2015
	PL	Category					T _м [year]
2-ch. OSSD	PL e	Cat. 4	SIL CL 3	4,10E-09	_	1,10E-04	20

Explanatory notes for the safety-related characteristic data:

- The SIL CL value in accordance with EN 62061 corresponds to the SIL value in accordance with EN 61508.
- T_M is the maximum mission time in accordance with EN ISO 13849-1. The value also applies as the retest interval in accordance with EN 61508-6 and IEC 61511 and as the proof test interval and mission time in accordance with EN 62061.

All the units used within a safety function must be considered when calculating the safety characteristic data.

INFORMATION

A safety function's SIL/PL values are **not** identical to the SIL/PL values of the units that are used and may be different. We recommend that you use the PAScal software tool to calculate the safety function's SIL/PL values.
