Introduction

Validity of documentation

This documentation is valid for the product PSEN sl-0.5n 2.1/2.2. It is valid until new documentation is published.

This operating manual explains the function and operation, describes the installation and provides guidelines on how to connect the product.

Using the documentation

This document is intended for instruction. Only install and commission the product if you have read and understood this document. The document should be retained for future reference.

Definition of symbols

Information that is particularly important is identified as follows:

DANGER!

This warning must be heeded! It warns of a hazardous situation that poses an immediate threat of serious injury and death and indicates preventive measures that can be taken.

WARNING!

This warning must be heeded! It warns of a hazardous situation that could lead to serious injury and death and indicates preventive measures that can be taken.

CAUTION!

This refers to a hazard that can lead to a less serious or minor injury plus material damage, and also provides information on preventive measures that can be taken.

NOTICE

This describes a situation in which the product or devices could be damaged and also provides information on preventive measures that can be taken. It also highlights areas within the text that are of particular importance.

INFORMATION

This gives advice on applications and provides information on special fea-

Safety

Intended use

Safety function of safety switch:

▶ 2 safety outputs, each of which supply a high signal when the actuator is in the safety switch's response range.

The safety gate system meets the requirements in accordance with

- ▶ EN 60947-5-3: PDDB with the corresponding actuator PSEN sl0.5 or PSEN sl0.5fm (see Technical details: System with normal actuator [☐ 25], System with free-moving actuator [☐ 28])
- ▶ EN 62061: SIL CL 3
- ▶ EN ISO 13849-1: PL e and Cat. 4
- ▶ EN ISO 14119: Coding level High, Type 4
- ▶ The safety switch may only be used with the corresponding actuator (see Technical Details: System with normal actuator [☐ 25], System with free-moving actuator [☐ 28]).

The safety level PL e (Cat. 4)/SIL CL 3 is only achieved if

▶ the safety outputs use 2-channel processing.

NOTICE

Positioning of the safety switch

As the safety switch is not intended for a guard locking device for personal protection, the safeguard monitored by the safety switch must be positioned in a way that the access time corresponds at least to the machine's stopping time.

Because of the low operating distance (see Technical details [25]) the repetition accuracy of 40 % deviates from the requirement in accordance with EN 60947-5-2 (max. 10%).

Improper use

The following is deemed improper use in particular

- Any component, technical or electrical modification to the product,
- ▶ Use of the product outside the areas described in this operating manual,
- Use of the product outside the technical details (see Technical details [4] 25]).

NOTICE

EMC-compliant electrical installation

The product is designed for use in an industrial environment. The product may cause interference if installed in other environments. If installed in other environments, measures should be taken to comply with the applicable standards and directives for the respective installation site with regard to interference.

INFORMATION

The magnet surface and counterplate may heat up. When installing, make sure that heat dissipation is guaranteed.

Safety regulations

Safety assessment

Before using a device, a safety assessment in accordance with the Machinery Directive is required.

The product as an individual component fulfils the functional safety requirements in accordance with EN ISO 13849 and EN 62061. However, this does not guarantee the functional safety of the overall plant/machine. To achieve the relevant safety level of the overall plant/machine's required safety functions, each safety function needs to be considered separately.

Use of qualified personnel

The products may only be assembled, installed, programmed, commissioned, operated, maintained and decommissioned by persons who are competent to do so.

A competent person is a qualified and knowledgeable person who, because of their training, experience and current professional activity, has the specialist knowledge required. To be able to inspect, assess and operate devices, systems and machines, the person has to be informed of the state of the art and the applicable national, European and international laws, directives and standards.

It is the company's responsibility only to employ personnel who

- ▶ Are familiar with the basic regulations concerning health and safety / accident prevention,
- ▶ Have read and understood the information provided in the section entitled Safety
- ▶ Have a good knowledge of the generic and specialist standards applicable to the specific application.

Warranty and liability

All claims to warranty and liability will be rendered invalid if

- ▶ The product was used contrary to the purpose for which it is intended,
- Damage can be attributed to not having followed the guidelines in the manual,
- Operating personnel are not suitably qualified,
- ▶ Any type of modification has been made (e.g. exchanging components on the PCB boards, soldering work etc.).

Disposal

- ▶ In safety-related applications, please comply with the mission time T_M in the safety-related characteristic data.
- ▶ When decommissioning, please comply with local regulations regarding the disposal of electronic devices (e.g. Electrical and Electronic Equipment Act).

For your safety

DANGER!

Risk to life due to manipulation/defeat of the safeguard

If replacement actuators are obtained, these must be installed as described in the chapter entitled Installation.

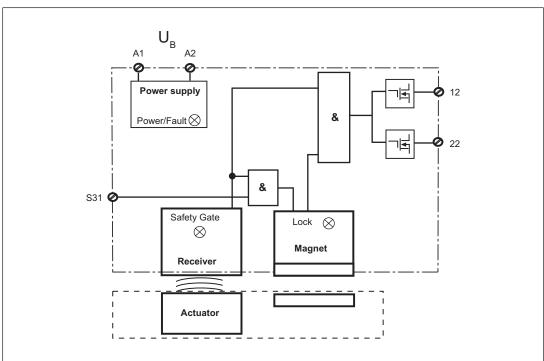

If replacement actuators are used manipulatively or the function of the safeguard is defeated, there is a risk to life when operating the plant or machine! This must be considered in the operator's hazard assessment and the operator must define appropriate measures to exclude manipulation.

▶ Do not remove the connector's protective cap until you are just about to connect the unit. This will prevent potential contamination.

Unit features

- ▶ Transponder technology for presence detection
- ▶ Device types Pilz coding type:
 - PSEN sl-0.5n 2.1: fully coded
 - PSEN sl-0.5n 2.2: uniquely coded
- ▶ different actuators available (see Order reference [☐ 33])
 - Standard actuator PSEN sl-0.5
 - free-moving actuator PSEN sl-0.5fm for special applications with higher tolerance compensation
- ▶ Dual-channel operation
- 2 safety outputs
- ▶ Magnetic guard locking for process protection
- ▶ 1 input to switch the locking magnet on/off
- ▶ LEDs for
 - Supply voltage/fault
 - Gate closed
 - State of the magnetic guard locking device
- ▶ M12, 5-pin male connector

Function description

There is a high signal at safety outputs 12 and 22 if the following occur simultaneously:

- ▶ The actuator is within the response range (safety gate closed) and
- ▶ There is a high signal at the input S31 (control command for magnetic guard locking) and
- ▶ The holding force of the locking magnet has been tested successfully.

There is a low signal at safety outputs 12 and 22 if **at least one** of the following conditions are met:

- ▶ The actuator is outside the response range or
- ▶ There is a low signal at the input S31 (control command for magnetic guard locking) or
- ▶ The holding force of the locking magnet has not been tested successfully.

Magnetic guard locking device and magnet monitoring

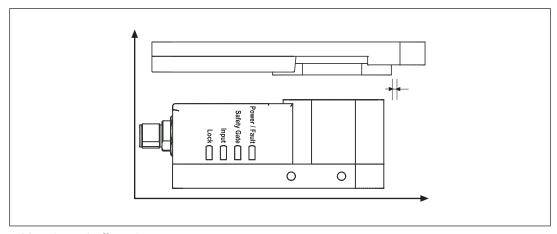

- ▶ The locking magnet is switched on if there is a high signal at input S31 (control command for magnetic guard locking) and the actuator is detected (safety gate closed).
- ▶ The holding force of the locking magnet is tested on power-up.
- After a signal change at the input S31 to low, wait for at least 500 ms, before supplying a high signal again at the input S31. Also note the max. switching frequency (see Technical details: System with normal actuator [25], System with free-moving actuator [28], under electrical data).

If an open winding or a winding short circuit is detected on a locking magnet that is switched on, safety outputs 12 and 22 switch to a low state.

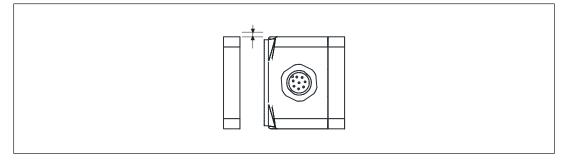

- ▶ For physical reasons, a remanence (residual magnetism) remains after the locking magnet is switched off; this is dissipated the first time the sensor and actuator are separated. Therefore a higher effort is required when opening for the first time.
- If the safety gate is in a locked condition and is opened by force, the safety outputs will shut down.

Lateral and vertical offset

Max. vertical offset: 5 mm

Max. lateral offset: 3 mm

Wiring

Please note:

- ▶ You must comply with the specifications stated in the technical details (see Technical details: System with normal actuator [☐ 25], System with free-moving actuator [☐ 28]).
- ▶ The power supply must meet the regulations for extra low voltages with protective electrical separation (SELV, PELV).
- ▶ The inputs and outputs of the safety switch must have protective separation from voltages over 60 VDC.
- ▶ Ensure the wiring and EMC requirements of EN 60204-1 are met.
- ▶ UL requirement: The supply voltage to the safety switch must be protected with a quick-acting fuse (see Technical details [25]).

Guidelines for cable length

The max. cable length depends on the voltage drop at the safety switches. The level of voltage drop is determined by the:

- ▶ Cable resistance
- ▶ Current of the device and the current load of the outputs

If the level of the supply voltage at the device connector falls below the minimum permitted value (see Technical details: System with normal actuator [25], System with free-moving actuator [28]), the locking magnet is no longer activated reliably. The "Lock" LED registers an error when guard locking.

Possible remedies:

- ▶ Set the supply voltage constantly to the upper tolerance range (see Technical details: System with normal actuator [☐ 25], System with free-moving actuator [☐ 28]).
- ▶ Select a higher conductor cross section
- ▶ Reduce load at the outputs, e.g. with evaluation device PNOZ e1.1p

Recommended cable cross sections

Prerequisite:

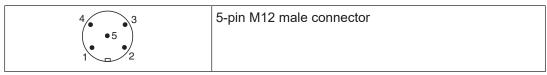

Supply voltage: 24 V

▶ Cable type: LiYY 5x0.25 mm² (79 Ohm/km) from Pilz

Max. load per safety output	100 mA	500 mA
Cable length	65 m	28 m

If cable lengths greater than those stated in the table are required, please contact Pilz.

Pin assignment

PIN	Function	Terminal designation	Cable colour (Pilz cable)
1	+24 V UB	A1	Brown
2	Output, channel1	12	White
3	0 V UB	A2	Blue
4	Output, channel2	22	Black
5	"Lock_Unlock"	S31	Grey

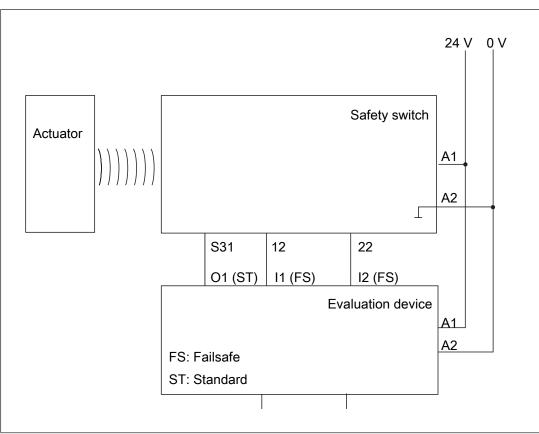

The wire colour also applies for the cable available from Pilz as an accessory.

Connection to evaluation devices

Make sure that the selected evaluation device has the following properties:

- ▶ 2-channel with feasibility monitoring
- ▶ OSSD signals are evaluated

Connection diagram, single connection

The safety switch PSEN sl-0.5n 2.1/2.2 can be connected to Pilz evaluation devices, for example.

Suitable Pilz evaluation devices are, for example:

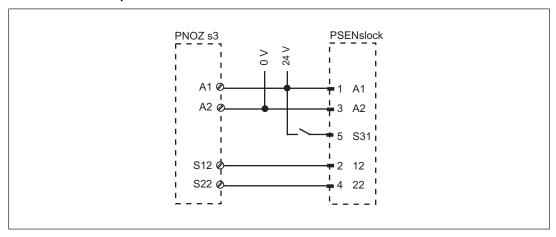

- ▶ PNOZelog for safety gate monitoring
- ▶ PNOZpower for safety gate monitoring
- ▶ PNOZsigma for safety gate monitoring
- ▶ PNOZ X for safety gate monitoring
- ▶ PNOZmulti for safety gate monitoring Configure the safety switch in the PNOZmulti Configurator with switch type 3.
- PSS for safety gate monitoring with standard function block SB064, SB066 or FS_Safety Gate

The correct connection to the respective evaluation device is described in the operating manual for the evaluation device. Make sure that the connection is made in accordance with the specifications in the operating manual for the selected evaluation device.

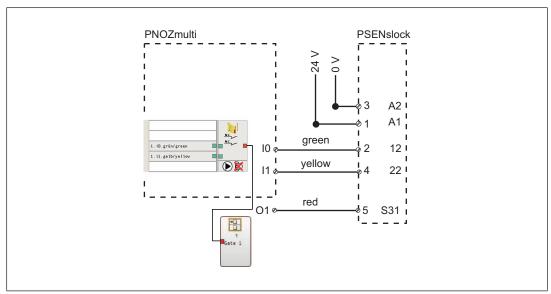

The connections to two evaluation devices are shown on the following pages, by way of example:

- ▶ PNOZ s3 and
- ▶ PNOZmulti

Connection example PNOZ s3

Connection example PNOZmulti

Legend:

10	Input OSSD
11	Input OSSD
12	Signal input
01	Lock/Unlock

Teaching in the actuator

PSEN sI-0.5n 2.1

Teaching in the actuator for the first time:

The first corresponding actuator to be detected by the safety switch (see Technical details: System with normal actuator [25], System with free-moving actuator [28]) is automatically taught in as soon as it is brought into the response range.

To teach in a new actuator:

- ▶ The actuator that is to be taught in must be brought into the safety switch's response range as the only transponder. As soon as the actuator is detected, the "Safety Gate" LED switches to a yellow flashing light.
- ▶ After a waiting period of 20 s has elapsed, the "Safety Gate" LED switches to quick yellow flashes. Trigger a system reset in the next 120 s by interrupting the power supply.
- ▶ When the device is switched back on, the learning procedure is complete and the number of permitted additional learning procedures is reduced by 1.
- ▶ A maximum of 8 learning procedures are possible.

NOTICE

The actuator must not be removed during the learning procedure.

INFORMATION

This actuator cannot be retaught on the same safety switch.

PSEN sI-0.5n 2.2

The first corresponding actuator to be detected by the safety switch (see Technical details: System with normal actuator [25], System with free-moving actuator [28], under mechanical data) is automatically taught in as soon as it is brought into the response range.

NOTICE

No other actuator may be taught in once this actuator has been taught.

Installation

▶ The safety gate system can be installed on left or right-hinged swing gates or on sliding gates.

WARNING!

Potential loss of safety function due to gross manipulation

Depending on the application, serious injury or death may result.

Use appropriate installation measures to prevent

- The wiring being modified.
- A short circuit being generated on the connector.
- The possibility of using a second actuator to open the safety gate.

CAUTION!

The unit's properties may be affected if installed in an environment containing electrically or magnetically conductive material. Please check the operating distances and the assured release distance.

- ▶ Safety switches and actuators must be positioned so that they are secured against a change of position.
- ▶ Also note the max. angular offset (see Technical details: System with normal actuator [☐ 25], System with free-moving actuator [☐ 28]).
- ▶ The access to the safety switch and actuator has to be possible for maintenance and checking the correct operation.
- ▶ Use reliable fastening elements. A tool is to be required to loosen the fastening elements.
- ▶ Prevent self-loosening of the fastening elements of safety switch and actuator.
- ▶ The fastening of safety switch and actuator has to be sufficiently stable to ensure the proper operation of the safety switch and the actuator.
- ▶ Prevent the safety switch and actuator being exposed to heavy shock or vibration.
- Circumvention of the safety switch in a reasonably foreseeable manner must be prevented.
- ▶ Installation measures in accordance with EN ISO 14119
 - Use permanently secured safety screws with a flat head to attach the safety switch and the actuator (e.g. cheese-head or pan head screws) or rivets.
- ▶ Alignment errors of the guard must not adversely affect the safety function of the guard.

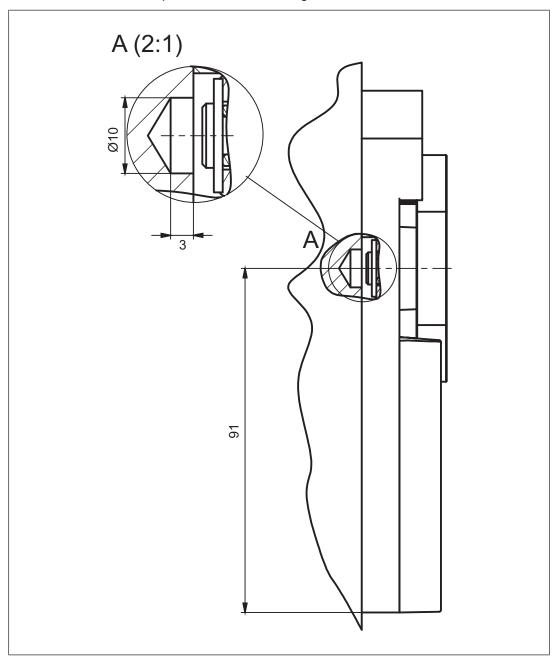

INFORMATION

Mounting brackets are available as accessories [44 33].

Note regarding the free-moving actuator PSEN sl-0.5fm

The free-moving actuators PSEN sl-0.5fm are fitted with a movable metal plate. For this reason, a recess must be provided in the mounting surface for the screw connection.

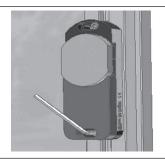

WARNING!

Risk of death and serious injury by reaching into the danger zone!

The actuators enable a warped gate to be closed. A gap may occur on the gate as a result. Make sure that the gap remains small enough to exclude the possibility of reaching into the danger zone.

Installing on a swing gate

Align the actuator flush with the edge of the gate at the height required and tighten the screws.

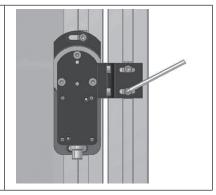

Close gate.

Align the mounting bracket flush with the safety switch and tighten the screws.

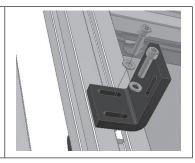

Align the safety switch and mounting bracket with the actuator and tighten the screws.

Installing on a sliding gate

Align the actuator mounting bracket flush with the sliding gate and tighten the screws.

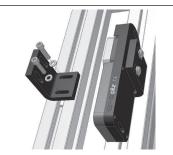

Install the actuator at the height required.

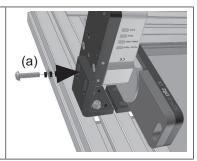

Align the safety switch mounting bracket flush with the frame and fasten with screws.

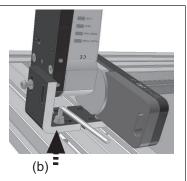

(Important: do not tighten the screws)

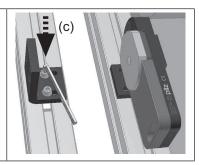

Fix safety switch upright with a screw (a), close gate.

Align mounting brackets, press firmly together and tighten screw (b).

Remove the safety switch and tighten screw (c).

Align the safety switch to the actuator and tighten the screws.

Adjustment

- ▶ The stated operating distances (see Technical details: System with normal actuator [☐ 25], System with free-moving actuator [☐ 28]) only apply when the safety switch and actuator are installed facing each other in parallel. Operating distances may deviate if other arrangements are used.
- Note the maximum permitted lateral and vertical offset (see Lateral and vertical offset [44] 10]).

Operation

NOTICE

The safety function should be checked after initial commissioning and each time the plant/machine is changed. The safety functions may only be checked by qualified personnel.

CAUTION!

Contaminated surfaces can reduce the holding force of the electromagnet.

Make sure that the contact surfaces are clean.

Status indicators:

- ▶ "Power / Fault" LED illuminates green: The unit is ready for operation
- ▶ "Safety Gate" LED lights up yellow: Actuator is within the response range
- ▶ "Lock" LED lights up green: Magnetic guard locking device active
- ▶ "Input" LED lights up yellow: The unit is ready for operation

Error display through periodic flashing:

"Power/Fault" LED lights up red: Error message Flashing codes for fault diagnostics are output to the "Safety Gate" or "Input" LED (see Error display through flashing codes).

Remedy: Rectify fault and interrupt power supply.

▶ "Lock" LED lights up red: Guard locking request is present, but guard locking has not taken place.

This behaviour occurs, for example, when the safety gate is open or the actuator is not within the response range or the holding force is too low.

Remedy: Rectify the cause (e.g. close safety gate), supply a low signal at input S31 and then supply a high signal again after at least 500 ms.

▶ "Input" LED lights up yellow: Internal error, change unit.

Please note the different times for

▶ The switch-on delay after UB is applied.

Error display through flashing codes

The "Safety Gate" and "Input" LEDs send flash signals; an error code can be established from the number and sequence. The "Power/Fault" LED illuminates red.

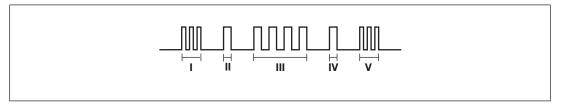

Each error code is indicated by three short flashes of the "Input" or "Safety Gate" LED. After a longer pause, the LED will then flash at one second intervals. The number of LED flashes corresponds to a digit in the error code. The error code can consist of up to 3 digits. The digits are separated by a longer period without flashing. The entire sequence is constantly repeated.

Number of flashes	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16
Decimal error code	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 0

Example:

Error code 1,4,1:

Flash frequency of the "Safety Gate" or "Input" LED

Meaning of flash frequency:

	Flash frequency	Meaning
I	3 times, short	Code for error message
П	Once, for one second each	Code for 1st digit
Ш	4 times, for one second each	Code for 2nd digit
IV	Once, for one second each	Code for 3rd digit
V	3 times, short	Code for error message repeated

Table of error codes

Error code Decimal	Number of flashes	Description	Remedy
1,4,1	3x short – 1x long – 4x long – 1x long – 3x short	Wiring errors at the inputs or outputs	Check the wiring of the inputs and outputs and rectify wiring errors
1,12	3x short – 1x long – 12x long – 3x short	Wiring error out- put 12	Check wiring output 12 and rectify wiring error
1,6,3	3x short – 1x long – 6x long – 3x long – 3x short	Wiring error out- put 12	Check wiring output 12 and rectify wiring error
1,13	3x short – 1x long – 12x long – 3x short	Wiring error out- put 22	Check wiring output 22 and rectify wiring error
1,6,4	3x short – 1x long – 6x long – 4x long – 3x short	Wiring error out- put 22	Check wiring output 22 and rectify wiring error
14	3x short – 14x long – 3x short	Wiring error out- put terminal 12 or capacitive load is too high (cable is too long)	Check wiring output 12 and rectify wiring error Check cable length and shorten it, if necessary (see max. cable length [11])
15	3x short – 15x long – 3x short	Wiring error out- put terminal 22 or capacitive load is too high (cable is too long)	Check wiring output 22 and rectify wiring error Check cable length and shorten it, if necessary (see max. cable length [11])

Other flashing codes signal an internal error. Remedy: Change device.

Supplementary data

Radio approval

USA/Canada

FCC ID: VT8-PSENSLN 7482A-PSENSLN

<u>FCC/IC-Requirements:</u>
This product complies with Part 15 of the FCC Rules and with Industry Canada licence-exempt RSS standards. Operation is subject to the following two conditions:

- 1) this product may not cause harmful interference, and
- 2) this product must accept any interference received, including interference that may cause undesired operation.

Changes or modifications made to this product not expressly approved by Pilz may void the FCC authorization to operate this equipment.

NOTE: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Le présent produit est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes:

- (1) le produit ne doit pas produire de brouillage, et
- (2) l'utilisateur de le produit doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement

Safety characteristic data

NOTICE

You must comply with the safety characteristic data in order to achieve the required safety level for your plant/machine.

Operating	EN ISO	EN ISO	EN 62061	EN 62061	IEC 61511	IEC 61511	EN ISO
mode	13849-1: 2015	13849-1: 2015	SIL CL/ maximum	PFH _D [1/h]	SIL	PFD	13849-1: 2015
	PL	Category	SIL				T _M [year]
2-ch. OSSD	PL e	Cat. 4	SIL CL 3	1,57E-09	SIL 3	1,38E-04	20

Explanatory notes for the safety-related characteristic data:

- > The SIL CL value in accordance with EN 62061 corresponds to the SIL value in accordance with EN 61508.
- ▶ T_M is the maximum mission time in accordance with EN ISO 13849-1. The value also applies as the retest interval in accordance with EN 61508-6 and IEC 61511 and as the proof test interval and mission time in accordance with EN 62061.

All the units used within a safety function must be considered when calculating the safety characteristic data.

INFORMATION

A safety function's SIL/PL values are **not** identical to the SIL/PL values of the units that are used and may be different. We recommend that you use the PAScal software tool to calculate the safety function's SIL/PL values.

Classification according to ZVEI, CB24I

The following tables describe the classes and specific values of the product interface and the classes of interfaces compatible with it. The classification is described in the ZVEI position paper "Classification of Binary 24 V Interfaces - Functional Safety aspects covered by dynamic testing".

Single-pole output	
Interfaces	
Source	
Interface	Sensor
Class	C2
Drain	
Interface	Evaluation device
Class	C1, C2
Source parameters	
Max. test pulse duration	500 μs
Max. rated current	0,1 A
Max. capacitive load	0,07 μF
