TURCK's IM series of Isolating Intrinsically Safe Barriers is designed to be a simple and safe way to solve the problems associated with the installation of equipment that is used in potentially explosive atmospheres. **TURCK's** IM series utilizes the intrinsically safe concept that is universally accepted, easy to apply and the safest way to install electronic measuring, monitoring and control equipment in potentially explosive atmospheres.
The IM series uses state of the art circuitry and the latest technology to produce an unsurpassed product that provides the best explosion protection interfaces on the market.

The IM series of Intrinsically Safe Interface Devices is application specific: Each device is designed to work in a specific application, be it analog input, analog output, discrete input, discrete output or others. The series was designed to handle the vast majority of applications where instrumentation and control in potentially explosive atmospheres is typically installed. A small number of interface devices will cover a large number of applications. This is a huge benefit, as limiting the number of different types of interfaces can significantly reduce the number of spares. Reducing the number of model variations of those spares makes replacement or expansion much easier, while also consolidating stock and making inventory easier to manage.

Intrinsic safety has come of age with the introduction of the IM series of Intrinsically Safe Isolating Barriers, making IS applications in potentially explosive atmospheres safe, simple and economically attractive.

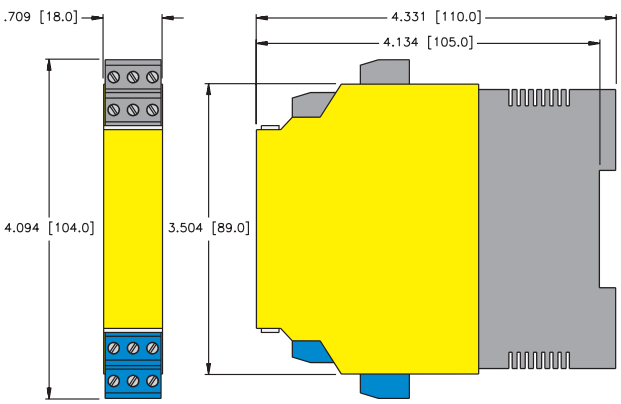
Choosing an appropriate IM series Isolator is made simple with the help of this guide. The interface devices outlined within this guide allow you to make the appropriate selection for the corresponding field devices or connections with ease.

IM Series Cabinet

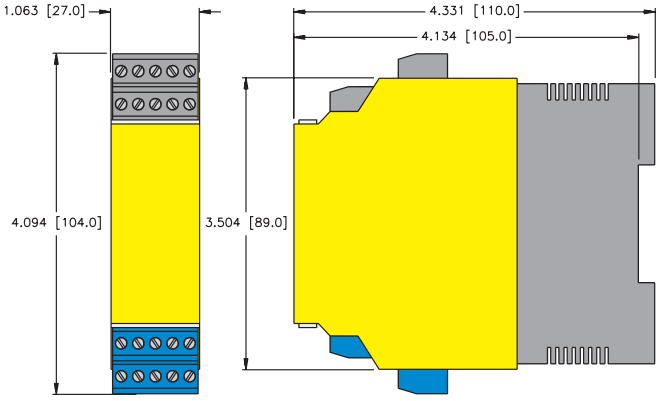
IS INTERFACE TECHNOLOGY

Generic Specifications for IM Series

Housing. . . . . 18 mm, Single or Multi-Channel, 12-Pin Connector Connector Configuration
27 mm, Multi-Channel, 20-Pin Connector Connector Configuration



18 mm Housing Size



27 mm Housing Size

Material. . . . . Polycarbonate/ABS Flammability Class V-0 UL94
Protection Level. . . . . IP 20
Operating Temperature . . . -25 to +60°C (-13 to +140°F)
Storage Temperature . . . . . -40 to +80°C (-40 to +176°F)
Mounting . . . . . 35 mm Top Hat Rail

Units are Class I, Division 2 groups A, B, C or D hazardous area mountable in an appropriate enclosure.
Units may be mounted side by side without spacing requirements.

Isolation Switch Relays

For Use with NAMUR Proximity Sensors and Mechanical Switches

TURCK offers a wide range of isolating switch relays. These devices can serve various applications ranging from a single dry contact switch input with a complimentary dry contact switch output, to four NAMUR proximity inputs and four transistor outputs, while also providing open and short-circuit protection in addition to alarm functionality.

Isolation switch relays may be used in general purpose applications, and most are certified for use in hazardous (explosive atmospheres) areas by various approvals bodies. These devices carry U.S., Canadian and European approvals that may be required in order to cover projects being engineered for use in locations throughout the world. The devices share many common attributes, such as housings and removable terminal connectors. Most are also available with the universal voltage (20-250 VAC/20-125 VDC) required to power the unit. All units have the option for short-circuit and open-circuit (wire-break) protection: a simple series of switches that can be manually configured by the user if the function is to be implemented. A resistor network (WM1 shown in Figure 1) is required to incorporate these functions when using a mechanical (dry contact) switch for the hazardous area inputs.

The IM series of isolation switch relays is designed to handle the vast majority of applications where mechanical switches or NAMUR proximity sensors are used. Short-circuit and open-circuit (wire-break) functions are available for most devices. This function can be implemented by appropriately configuring the switches located on the top of the units. NAMUR proximity switches have no special requirements in order to incorporate this function, simply set the switches to the appropriate positions.

Dry contact (mechanical switches) however, require the use of a resistor network in order for the additional functions to operate properly. The incorporation of a ready made resistor network module (WM1 see Figure 1) is recommended.

This section highlights the devices and provides a simple approach for installing the various models available. Examples of common applications are provided along with simple connection diagrams that allow any user to easily and safely install these devices.

Typical and specific functions for each individual device are highlighted in the "Features" portion of the specification pages. A handy pin-out reference chart is also provided for each device. Input and output common configurations for use with NAMUR proximity sensors and dry contact mechanical switches, are also highlighted in this section.

Common Input Configuration for Proximity Sensors

NAMUR 2-wire proximity sensors are specifically designed to work with **TURCK** isolation switch relays. No entity calculations are required, as all NAMUR proximity sensors and associated apparatus with NAMUR inputs (**TURCK** isolation switch relays) are designed to be 100% compatible without the requirement to calculate entity parameters. These calculations are accounted for in the design of both the field devices (proximity sensors) and the interfaces (barriers). All NAMUR proximity sensors are compatible with NAMUR interface devices in all classified areas.

The 2-wire configuration is standardized so the blue wire is always negative and the brown wire is always positive. Reversing these connections will not damage the device, however it will not function.

Connection diagrams for individual devices are shown in the product specification description pages.

Common Input Configurations for Dry Contact Mechanical Switches

Simple switch inputs are easily accommodated by the NAMUR input interface units. Switches are not required to be approved as intrinsically safe devices. Simple switches are defined as "simple apparatus" by the national electrical code as: (NEC 504-2)
A device that will neither generate nor store more than 1.2 V, 0.1 A, 25 mW, or 20 µ.

Using a simple switch does require the use of a resistor network (WM1) if the short-circuit and open-circuit (wire-break) functions are not used. These functions are not required and can be disabled by simply switching the function "OFF" using the configuration switches on the top of the units.

Transistor Switch

All IM1-xxx Modules are Equipped With:

Intrinsically Safe Field Terminals

This feature allows the use of any certified NAMUR sensor or dry contact mechanical switch (simple apparatus) to be used in any area classification without risk of explosion.

Universal Input Voltage

This feature allows any power supply with an output of 20-250 VAC or 20-125 VDC to be used to power the units. This provides extreme flexibility in the source power required to operate the units.

Removable "Keyed" Terminals

This feature allows easy wiring. The keyed connectors assure safe and accurate installation. Terminals can be removed and wired without physically making the connections in tight quarters. Cable harnesses that incorporate these connectors can actually be wired outside cabinets, and assembly is completed by plugging in the terminals to the corresponding barrier. A bus power configuration is also available. That allows several barrier's power connections to be bussed in a daisy-chain configuration, further reducing installation time and wiring. Replacement of units when necessary is also simplified.

Short-circuit and Open-circuit Detection

This feature allows monitoring of field circuits for wire faults. The function is selectable and can be disabled if not required or desired. NAMUR sensors need no accessory to provide the function. Dry contact mechanical switches require a resistor network to properly function. The WM1 resistor network module will provide this function, or a network of discrete resistors can be added by the user. Utilization of a common non-hazardous area alarm circuit signifies a fault in the hazardous area wiring.

N.O./N.C. Configuration

This feature allows the input function to be selected as a normally open or normally closed output. Each channel can be separately configured depending on module type.

Galvanic Isolation

This feature provides isolation between inputs, outputs and the power supply. In some cases, individual outputs are also isolated from each other.

Switching Status and Power Indication LEDs

This feature provides a visual indication for the switching status of each channel. The green LED indicates that the unit is powered. The dual color LEDs indicate switching (yellow) and fault status (red). A fault status on an input disables the corresponding output relay.

Housing Sizes

The size depends on the number of channels. All 4-channel devices utilize the wider 27 mm housing, while the 1 and 2-channel devices are housed in the 18 mm style. Both are the same height, and can be mounted on a DIN-rail or flush mounted on a panel.

Hazardous (Classified) Area

The hazardous area terminals of the IM series switch input isolators are suitable for use with mechanical switch or NAMUR inputs in ALL area classifications.

Shown here is the common input configuration for a NAMUR proximity sensor. The wires are color coded and blue is always the (-) terminal and brown is always the (+) terminal.

Open-circuit (wire-break) and short-circuit can be configured by the switch settings on the top of the unit, if the unit is equipped with this function. No special conditions are required to incorporate the function when using NAMUR proximity sensors.

Division 2/Zone 2 or Non-Hazardous Areas

IM units are certified to be mounted in a Division 2/Zone 2 area. Units must be housed in an appropriate enclosure suitable for the environment in which they will be installed.

Explosion-proof or purged enclosures are not required for use in this area classification with the **TURCK** IM series.

Non-Hazardous (Non-Classified) Area

Non-hazardous area terminals are designed to be connected to apparatus in a non-classified area.
The equipment may consist of alarm circuits, PLC or DCS controllers or other similar types of equipment.

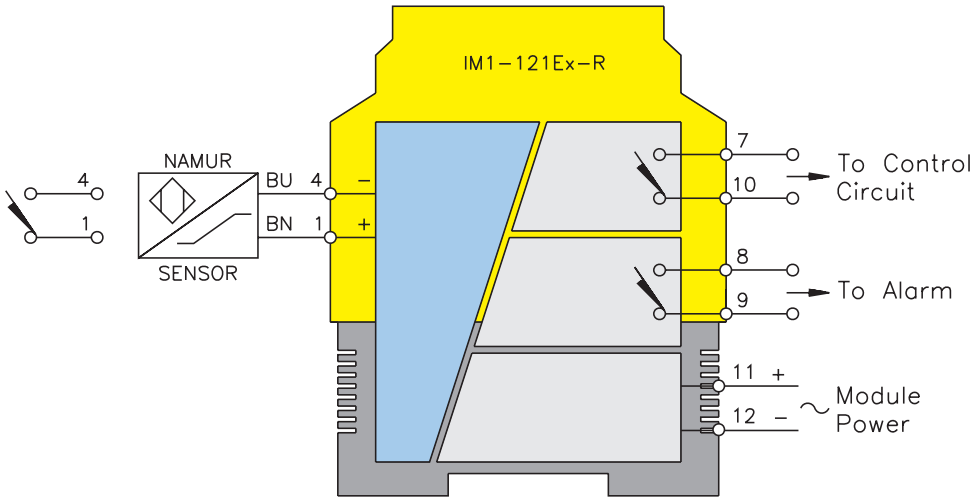
IM1-121Ex-R — Isolation Switch Relays



Functional Description:

This 1 channel intrinsically safe interface device is designed to accommodate 1 switch or NAMUR proximity sensor input from a hazardous area and repeat the change of state of the field circuits to a control system located in a non-hazardous area.

The non-hazardous area output is a SPST switch reflecting the corresponding input change of state from the field circuit.

The device also incorporates a separate SPST Non-Hazardous area alarm switch for monitoring open or short-circuits in the hazardous area.

Features:

- 1 channel input for NAMUR sensors or mechanical switches
- Monitoring of field wiring for open or short-circuit (if required)
- Configuration switches on top of unit for easy access
- 2 non-hazardous area switch outputs, 1 for alarm function
- Selectable N.O./N.C. outputs

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage - (20-250 VAC or 20-125 VDC)

Inputs	(8.2 V, 8.2 mA)
Switching Threshold	1.55 mA
Hysteresis	Typical 0.2 mA
Open-circuit Threshold	≤0.1 mA
Short-circuit Threshold	≥6.0 mA

Outputs: Non-Hazardous Area

2 Relays, 1 N.O. Contact Each

Voltage	≥250 VAC/120 VDC
Current	≥2 A per channel
Capacity	≥500 VA/60 W per channel
Switch Frequency	≥10 Hz
Contacts	Silver-Alloy + Au (3 micro μ)

For entity parameters see control drawings on pages B86 - B91.

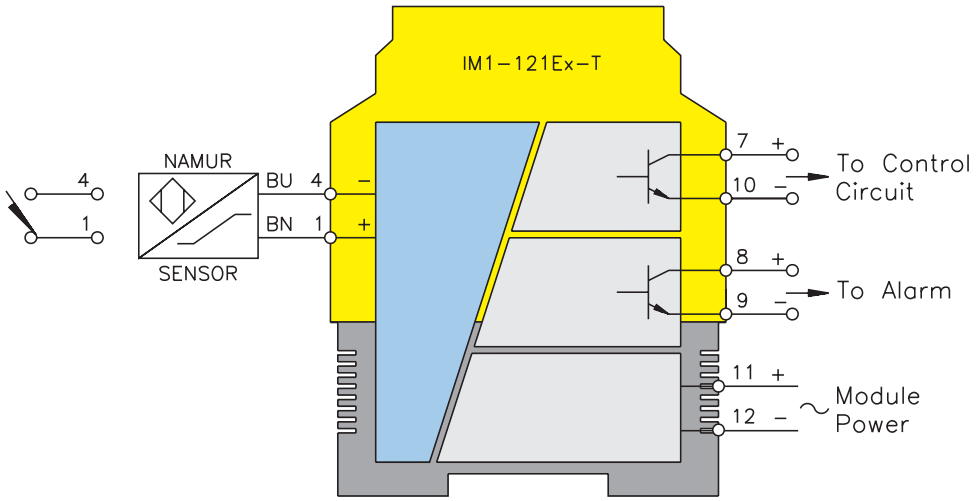
IM1-121Ex-T — Isolation Switch Relays



Functional Description:

This 1 channel intrinsically safe interface device is designed to accommodate 1 switch or NAMUR proximity sensor input from a hazardous area and repeat the change of state of the field circuits to a control system located in a non-hazardous area.

The non-hazardous area output is an open collector transistor reflecting the corresponding input change of state from the field circuit when properly configured.

An alarm output is also incorporated.

Features:

- 1 channel input for NAMUR sensors or mechanical switches
- Monitoring of field wiring for open or short-circuit (if required)
- Configuration switches on top of unit for easy access
- 2 isolated short-circuit protected non-hazardous area open collector transistor outputs, 1 for alarm function
- Selectable N.O./N.C. outputs

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage - (20-250 VAC or 20-125 VDC)

Inputs	(8.2 V, 8.2 mA)
Switching Threshold	1.55 mA
Hysteresis	Typical 0.2 mA
Open-circuit Threshold	≤0.1 mA
Short-circuit Threshold	≥6.0 mA

Outputs: Non-Hazardous Area

2 Transistors, Potential Free Short-Circuit Protected

Switching Voltage	≤30 VDC
Switch Current	≤50 mA per channel
Switch Frequency	≤5 kHz
Voltage Drop	≤1.3 V

For entity parameters see control drawings on pages B86 - B91.

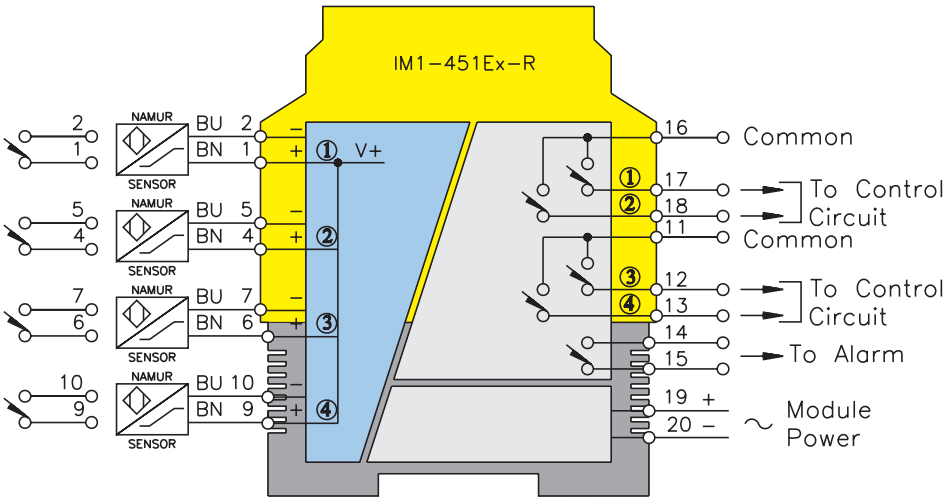
IM1-451Ex-R — Isolation Switch Relays



Functional Description:

This 4 channel intrinsically safe interface device is designed to accommodate four switches or NAMUR proximity sensor inputs or any combination of the two from a hazardous area and repeat the change of state of the field circuits to a control system located in a non-hazardous area.

The non-hazardous area outputs are four separate SPST switches reflecting the corresponding change of state from each individual input of the field circuit, to its appropriate corresponding output.

A common alarm switch for all four channels is also incorporated.

Features:

- 4 channel input for NAMUR sensors or mechanical switches
- Monitoring of field wiring for open or short-circuit (if required)
- Configuration switches on top of unit for easy access
- 4 SPST non-hazardous area outputs; 1 for each channel and 1 common alarm
- Selectable N.O./N.C. outputs

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage - (20-250 VAC or 20-125 VDC)

Inputs	(8.2 V, 8.2 mA)

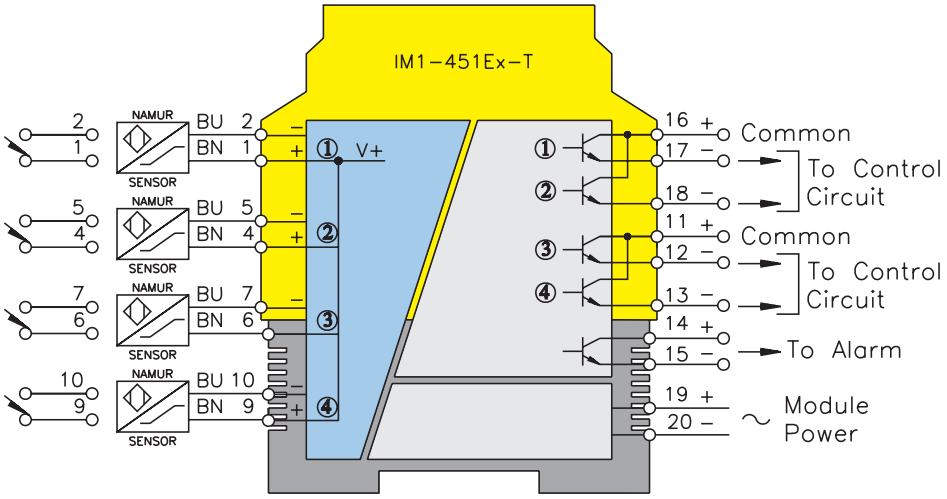
IM1-451Ex-T — Isolation Switch Relays



Functional Description:

This 4 channel intrinsically safe interface device is designed to accommodate four switches or NAMUR proximity sensor inputs or any combination of the two from a hazardous area and repeat the change of state of the field circuits to a control system located in a non-hazardous area.

The non-hazardous area outputs are four open collector transistors reflecting the corresponding change of state from each individual input of the field circuit, to its appropriate corresponding output when appropriately configured.

A common alarm transistor for all four channels is also incorporated.

Features:

- 4 channel input for NAMUR sensors or mechanical switches
- Monitoring of field wiring for open or short-circuit (if required)
- Configuration switches on top of unit for easy access
- 4 short-circuit protected open collector transistor non-hazardous area outputs; 1 for each channel and 1 alarm
- Selectable N.O./N.C. outputs

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage - (20-250 VAC or 20-125 VDC)

Inputs	(8.2 V, 8.2 mA)
Switching Threshold	1.55 mA
Hysteresis	Typical 0.2 mA
Open-circuit Threshold	≤0.1 mA
Short-circuit Threshold	≥6.0 mA

Outputs: Non-Hazardous Area

5 Transistors, Potential Free Short-Circuit Protected

Switching Voltage	≤30 VDC
Switch Current	≤50 mA per channel
Switch Frequency	≤3 kHz
Voltage Drop	≤2.5 V

For entity parameters see control drawings on pages B86 - B91.

Analog Data Transmitters

Analog data transmitters are a selection of devices that allow the transmission of hazardous area analog signals to a non-hazardous area as a direct one-to-one, or with a slight variation that is sometimes desired for specific applications.

The Analog Isolating Transmitters can transfer 4-20 mA, 0-20 mA, 0-10 V or 2-10 V signals from a hazardous area and repeat the signal in the non-hazardous area either as a current or a voltage signal; 2 current signals or a 2 channel one-to-one combination, depending on the module.

These devices offer a much requested and much desired mix of inputs and outputs that are sometimes difficult to achieve with conventional intrinsically safe interface devices. Flexibility is a key feature of these devices, with the option to convert from voltage to current or from current to voltage where required. The multi-channel device also provides a compact high-density solution for applications where space is an issue.

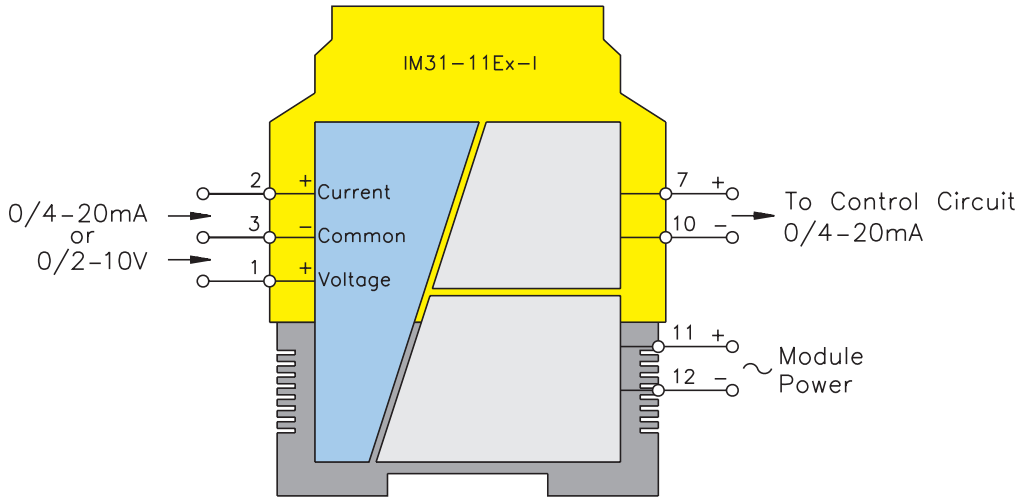
IM31-11Ex-I — Analog Data Transmitters



Functional Description:

This 1 channel intrinsically safe interface will receive either a 0/4-20 mA or 0/2-10 V signal from a hazardous area and repeat the signal in the non-hazardous area as either a 0-20 mA or 4-20 mA signal reflecting the hazardous area input. It will drive a non-hazardous area load of up to 500 Ω.

In switch position "1:1" the hazardous area inputs are reflected one-to-one in the non-hazardous area. In position "LZ" a dead-zero signal (0-10 V or 0-20 mA) input is reflected as a live-zero signal (4-20 mA) output.

Features:

- 1 channel analog data transfer/converter
- Choice of input signal voltage or current
- Choice of output signal voltage or current
- Short-circuit protected output

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage - (20-250 VAC or 20-125 VDC)

Inputs . . . . . 0-10 V (≤20 V)
Input Resistance . . . . . 50 K Ω
Current . . . . . 0-20 mA (≤40 mA)
Input Resistance . . . . . 50 Ω

Outputs: Non-Hazardous Area

0/4-20 mA

Load . . . . . ≤500 Ω

For entity parameters see control drawings on pages B86 - B91.

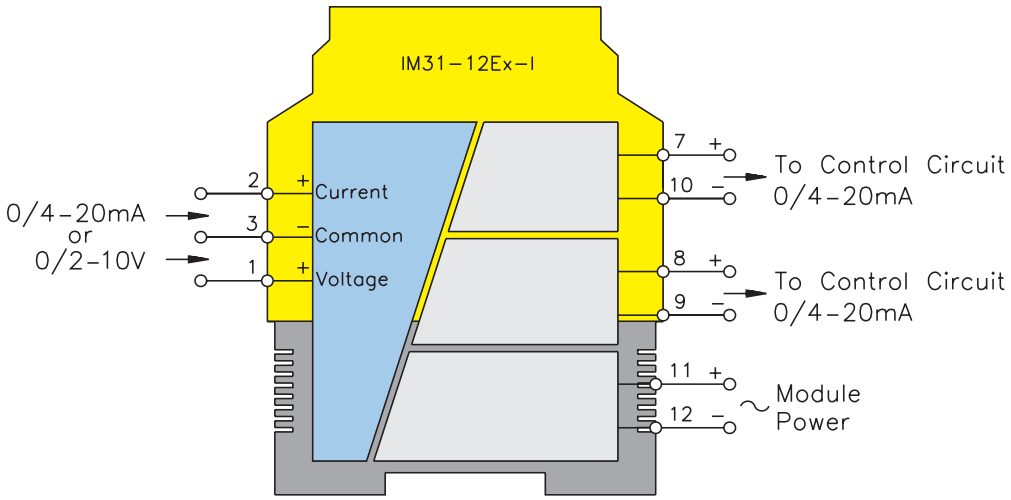
IM31-12Ex-I — Analog Data Transmitters



Functional Description:

This 1 channel intrinsically safe interface will receive either a 0/4-20 mA or 0/2-10 V signal from a hazardous area and repeat the signal in the non-hazardous area as 2 separate 0-20 mA or 4-20 mA signals reflecting the hazardous area input. It will drive 2 separate non-hazardous area loads of up to 500 Ω each.

In switch position "1:1" the hazardous area inputs are reflected one-to-one in the non-hazardous area. In position "LZ" a dead-zero signal (0-10 V or 0-20 mA) input is reflected as 2 separate live-zero signal (4-20 mA) outputs.

Features:

- 1 channel analog data transfer/converter
- Choice of input signal voltage or current
- Two, 0/4-20 mA current output signals
- Short-circuit protected outputs

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage - (20-250 VAC or 20-125 VDC)

Inputs . . . . . 0-10 V (≤20 V)
Input Resistance . . . . . 50 K Ω

Notes:

Analog Input Repeaters/Supplies

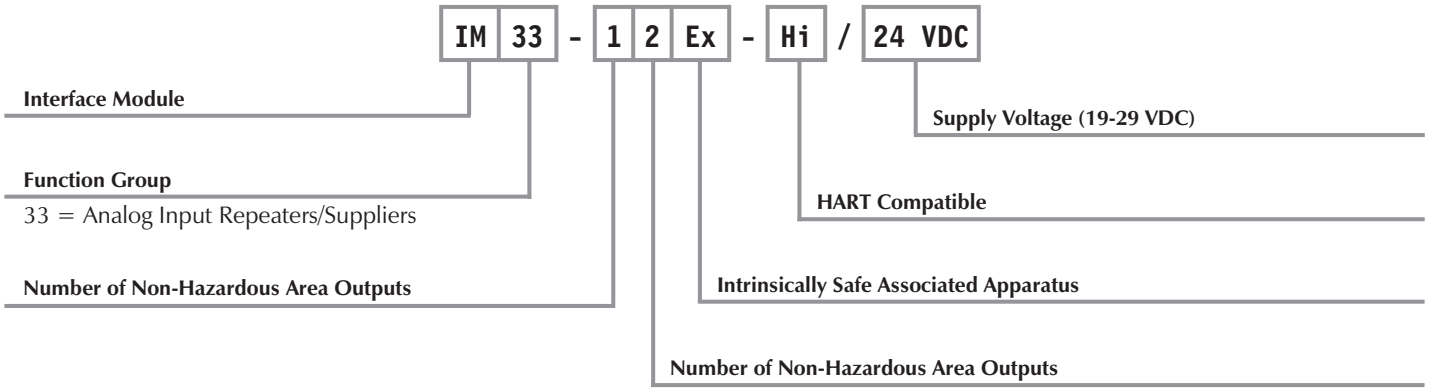
The analog input repeaters/supplies interfaces in this section are designed to work with the vast majority of analog input field devices. Field devices can range from a simple 2-wire 4-20 mA transmitter to a 3-wire HART smart device requiring the interface to provide operating power and a bi-directional path for the digital HART information along with the 4-20 mA control signal. The analog input units will also accept a source signal from a separately powered field device, or other source generated by an "IS" device in a hazardous area. The unit can also be used to receive a source "IS" signal from a 0/4-20 mA driver with "IS" outputs in another non-hazardous area. The "IS" driver/"IS" receiver combination render the cable connections intrinsically safe thus allowing the driver/reciever cable to be used with other "IS" signals in multi-core cables or in an "IS" cable tray.

The analog input units versatility allows easy selection for most transmitter applications, thus reducing stock and inventory further simplifying the selection process. The control system can also be configured to provide alarm functions for certain states indicating the short or open-circuit conditions for the units.

Ease of installation is inherent when applying these devices.

Analog Input Repeaters/Supplies — Part Number Key

Part Number Keys are to assist in IDENTIFICATION ONLY. Consult factory for catalog items not identified.



Extension Examples:

IM33-12Ex-Hi/24 VDC
Interface Module
Analog Input Repeaters/Supplies
Single Channel Input
Two Non-Hazardous Area Current Outputs
Intrinsically Safe Associated Apparatus

24 VDC Supply Voltage

IM33-11Ex-Hi/24 VDC — Analog Input Repeaters/Supplies

Pin #	Terminal Function
1	(+) 2-wire or 3-wire Field Power
2	(+) 2-wire or 3-wire Field Power
3	(-) Field Power for 2,3 Wire Device
4	N/C
5	N/C
6	N/C
7	(+) 4/20 mA Non-Hazardous Area Output
8	N/C
9	N/C
10	(-) 4/20 mA Non-Hazardous Area Output
11	Module Power (+) or AC
12	Module Power (-) or AC

Functional Description:

This 1 channel intrinsically safe interface will power a 2 or 3-wire HART transmitter or a separately powered field device. It will retransmit the 0-20 mA or 4-20 mA signal from a hazardous area, and repeat the signal in the non-hazardous area as a 0-20 mA or 4-20 mA signal reflecting the hazardous area input. The device will also accept a source 0-20 mA or 4-20 mA signal from a separately powered field device and repeat this signal in the non-hazardous area. It will drive a non-hazardous area load of up to 500 Ω.

Due to the "1:1" transmission characteristic, open circuit or short circuit conditions can be indicated by a 0 mA or 22.5 mA reading indicating the condition for alarm implementation.

HART or conventional transmitters can be accommodated by this device with bi-directional communications of digital information with HART field devices.

Features:

- 1 channel HART or "IS" compatible Analog Input
- 2, 3 or 4-wire configurations for sinking or sourcing field devices
- Constant field voltage
- Short-circuit protected field circuit
- Over/under current indication of 0 or 22.5 mA
- SIL 2 rated

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage - (19-29 VDC)

Input Resistance . . . . . 250 Ω

Operating Characteristics:
Voltage. . . . . 17 V @ 20 mA
Current . . . . . 0-22 mA
Short-circuit Current (short-term) 60 mA (for 50 ms)

Outputs: Non-Hazardous Area

0/4-20 mA

Load . . . . . ≤500 Ω
Open-circuit Indication . . 0 mA
Closed-circuit Indication . . ≥22.5 mA

For entity parameters see control drawings on pages B86 - B91.

Closed-circuit Indication . . ≥22.5 mA

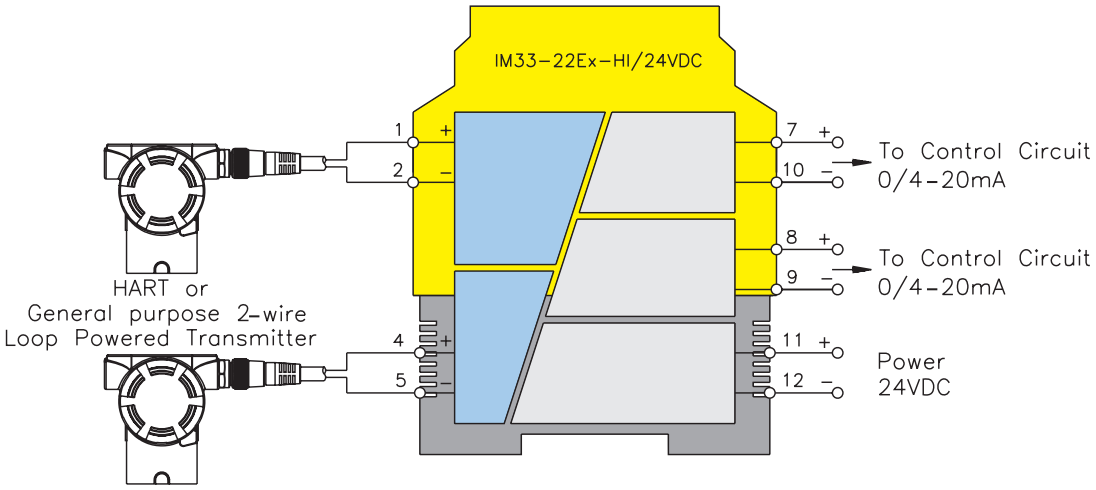
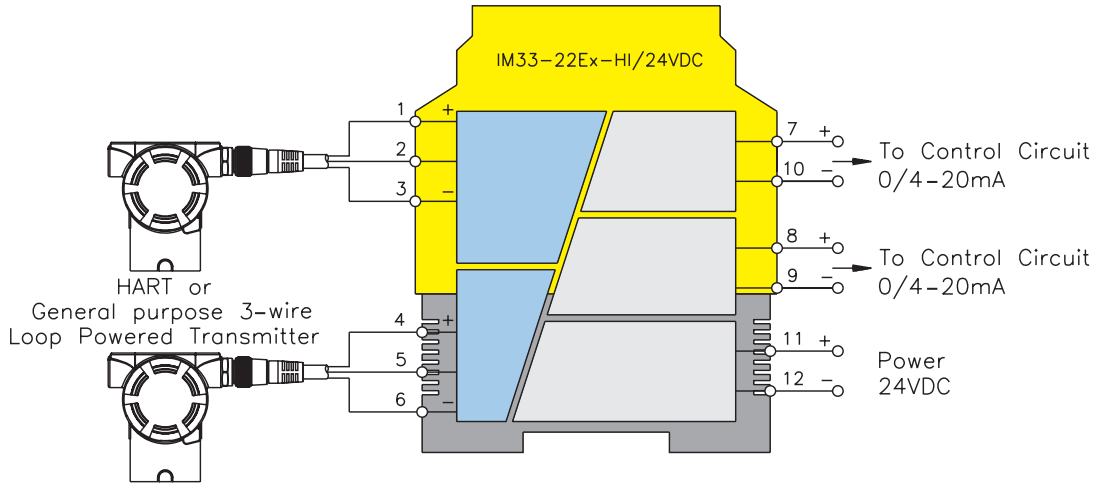
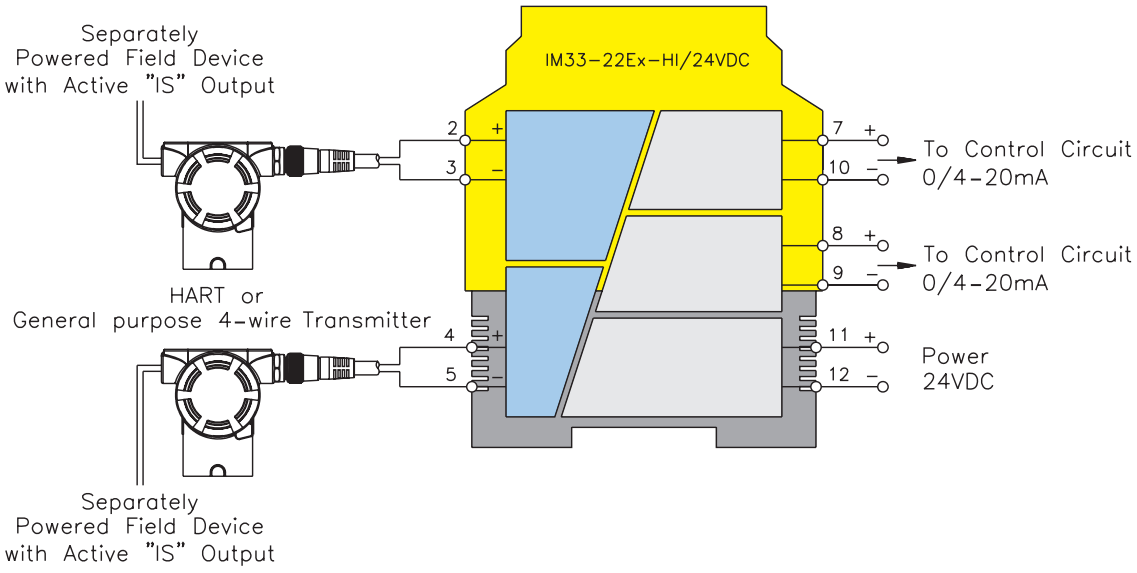
Analog Input Repeaters/Supplies — IM33-22Ex-Hi/24 VDC







Temperature Converters

Temperature measurement is a very common application, even in hazardous areas. The IM34 temperature converting device provides advanced diagnostics, versatility and convenience in an easy-to-use device.

The IM34 will convert a 2, 3 or 4-wire RTD, mV signal, or T/C in a hazardous area, to an analog 0/4-20 mA signal in a non-hazardous area. This pushbutton or software (FDT/DTM, free shareware) configurable unit is simple to use and saves time and money on installations.

This diverse unit allows several different input types to be configured and used with common 0/4-20 mA analog input control cards. Elimination of separate RTD, T/C and mV input cards may consolidate inventory, as well as allow the use of off-the-shelf "Simple Apparatus" components in even the most explosive atmospheres; further reducing costs for installation and maintenance.

Temperature measurement in hazardous areas has never been easier, or as safe, than this.

Temperature Converters — Part Number Key

Intrinsically Safe Associated Apparatus
Computer or Remote Configuration
Alarm Contacts
Non-Hazardous Current Output
Universal Voltage Input

IM34-11Ex-I — Temperature Converters

Functional Description:

This single channel device is designed to provide an analog 0/4-20 mA signal to a control system that is converted from an RTD, T/C, or mV signal in a hazardous area.

The measuring range and device functions are set via rotary switches or slide switches on the side of the device.

Features:

- 1 channel temperature input
- Accepts 2, 3, or 4-wire RTD's, T/C's or mV
- Switch configurable by user
- Temperature range adjustable
- Over/under current indication of 0 or 22 mA
- Internal or external CJC configurable

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage - (20-250 VAC or 20-125 VDC)

2, 3 or 4-wire 100 Ω Ni or Pt RTD's

Range -200°K to +800°K (Pt100), -60°K to +250°K (Ni100)

T/C's B, E, J, K, N, R, S, T

Low Voltage -160 mV to +160 mV

Resistor current approx. 200 microamps

Outputs: Non-Hazardous Area

0/4-20 mA (Load 600 Ω max)

Relay: 250 VAC/120 VDC, 2A
500 VA/60 W 10Hz

For entity parameters see control drawings on pages B86 - B91.

IM34-12Ex-Ri — Temperature Converters

Functional Description:

This single channel device is designed to provide an analog 0/4-20 mA signal to a control system that is converted from an RTD, T/C, or mV signal in a hazardous area.

This device has the added function of a relay output that can be used for under/over range conditions or to monitor a limit value.

The measuring range and device functions are set via rotary switches or slide switches on the side of the device.

Features:

- 1 channel temperature input
- Accepts 2, 3, or 4-wire RTD's, T/C's or mV
- Switch configurable by user
- Temperature range adjustable
- Configurable limit value relay output
- Over/under current indication of 0 or 22 mA
- Internal or external CJC configurable

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage - (20-250 VAC or 20-125 VDC)

2, 3 or 4-wire 100 Ω Ni or Pt RTD's

Range -200°K to +800°K (Pt100), -60°K to +250°K (Ni100)

T/C's B, E, J, K, N, R, S, T

Low Voltage -160 mV to +160 mV

Resistor current approx. 200 microamps

Outputs: Non-Hazardous Area

0/4-20 mA (Load 600 Ω max)

Relay: 250 VAC/120 VDC, 2A
500 VA/60 W 10Hz

For entity parameters see control drawings on pages B86 - B91.

Functional Description:

This single channel device is designed to provide an analog 0/4-20 mA signal to a control system that is converted from an RTD, T/C or mV signal in a hazardous area.

This device is software configurable using the PACT*ware* software tool and a configuration cable that allows configuration to be achieved through your laptop or PC.

Features:

- 1 channel temperature input
- Accepts 2, 3 or 4-wire RTD's, T/C's or mV
- Software configurable by user via PC using PACTware with software tool "Device Type Manager" (DTM)
- Temperature range adjustable
- Over/under current indication of 0 or 22 mA
- Internal or external CJC configurable

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage - (20-250 VAC or 20-125 VDC)

2, 3 or 4-wire 100 Ω Ni or Pt RTD's

Range -200°K to +800°K (Pt100), -60°K to +250°K (Ni100)

T/C's B, E, J, K, N, R, S, T

Low Voltage -160 mV to +160 mV

Resistor current approx. 200 microamps

Outputs: Non-Hazardous Area

0/4-20 mA (Load 600 Ω max)

For entity parameters see control drawings on pages B86 - B91.

IM34-12Ex-CRi — Temperature Converters

Functional Description:

This single channel device is designed to provide an analog 0/4-20 mA signal to a control system that is converted from an RTD, T/C or mV signal in a hazardous area.

This device is software configurable using the PACT*ware* software tool and a configuration cable that allows configuration to be achieved through your laptop or PC.

This device has the added function of a relay output that can be used for under/over range conditions or to monitor a limit value.

Features:

- 1 channel temperature input
- Accepts 2, 3 or 4-wire RTD's, T/C's or mV
- Software configurable by user via PC using PACTware with software tool "Device Type Manager" (DTM)
- Temperature range adjustable
- Configurable limit value relay output
- Over/under current indication of 0 or 22 mA
- Internal or external CJC configurable

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage - (20-250 VAC or 20-125 VDC)

2, 3 or 4-wire 100 Ω Ni or Pt RTD's

Range -200°K to +800°K (Pt100), -60°K to +250°K (Ni100)

T/C's B, E, J, K, N, R, S, T

Low Voltage -160 mV to +160 mV

Resistor current approx. 200 microamps

Outputs: Non-Hazardous Area

0/4-20 mA (Load 600 Ω max)

Relay: 250 VAC/120 VDC, 2A
500 VA/60 W 10Hz

For entity parameters see control drawings on pages B86 - B91.

Temperature Converters

IM34-11Ex-I

IM34-12Ex-Ri

Short Description

- Inputs for Ni100 or Pt100 acc. to IEC 751, thermoelements acc. to IEC 584 and for low voltages (mV range)
- Intrinsically safe input circuit [EEx ia] IIC
- Area of application acc. to ATEX: II (1) GD
- Wire-break monitoring
- Short-circuit monitoring of Pt100 or Ni100 components
- Galvanic isolation between input and output circuits and supply
- Analogue current output 0/4-20 mA
- Limit value relay (IM34-12Ex-Ri only)
- Temperature linear conversion
- Device configuration on side of housing
- Housing with coded and removable terminal blocks

Terminal Configuration

Intrinsically safe inputs at terminals 1-6

1, 2	Thermoelement and mV input
3-6	Ni100 or Pt100 input
7, 8	Analogue current output
9,10	Limit value relay (IM34-12Ex-Ri only)
11,12	Supply voltage connection
	20-250 VAC/20-125 VDC, ≤3 W

Connection via flat screw terminals with self-lifting pressure plates, connection profile ≤1 x 2.5 mm², 2 x 1.5 mm² or 2 x 1.0 mm² with wire sleeves.

LED Indications

Pwr	green power on (1)
ϟ	red error (2)
1	yellow relay energized (3) (IM34-12Ex-Ri only)

Attention: Status indications, see table on page B64.

Adjustments

The device settings are accomplished with 4 rotary switches and 10 slide switches (IM34-12Ex-Ri:7 rotary switches and 13 slide switches) located on the right side of the housing.

- **High Temperature Value T_H:** the upper temperature range value according to an output current of 20 mA is set with the two rotary switches (1, 2). Rotary switch 2 serves to set temperature values in increments of a hundred degrees celsius. Switch 1 serves to set the temperature in steps of ten degrees. Thus, the temperature values can be set in steps of 10 K. (Example for switch position: 53 ⇒ 530°C). If the slide switch S6 is in position 1, the temperature range is automatically increased by a 1000°C to 1000-1990°C. Add a 1000°C to the temperature value adjusted with rotary switches 1 and 2. (Examples for switch position: 53 ⇒ 1530°C; 00 ⇒ 1000°C).
- **Low Temperature Value T_L :** the two rotary switches (3, 4) serve to set the temperature which accords to an output current of 0 or 4 mA (determined by slide switch S8). If slide switch S5 is in position 1, rotary switch number 4 is used to adjust the temperature in hundreds, while switch 3 adjusts the tens place. Adjustment takes place in a temperature range of 0 to +990°C in increments of 10 K (e.g. rotary switch setting 23 accords to a temperature of 230°C). If slide switch S5 is in position 0, rotary switch 4 adjusts the negative tens places and rotary switch 3 adjusts the ones. Adjustments are possible in a temperature range of -100 to -1°C in increments of 1 K. (Examples for rotary switch position: 23 ⇒ -23°C; 00 ⇒ -100 °C).
- **Switching Threshold for Relay**
  (IM34-12Ex-Ri only)
  Rotary switch 5 = hundred degree values
  Rotary switch 6 = ten degree values
  Rotary switch 7 = one degree values
  S11 and S12 = 1: add 1000°C to the adjusted value. S11 = 0: the adjusted value is negative. The output mode is adjusted with S13.

IM34-11Ex-I

IM34-12Ex-Ri

Switch Position				Functions of slide switches S1-S4: The 4 switches serve to select the following functions:
S1	S2	S3	S4	
0	0	0	0	Thermoelement Type B (IEC 584)
0	0	0	1	Type E
0	0	1	0	Type J
0	0	1	1	Type K
0	1	0	0	Type N
0	1	0	1	Type R
0	1	1	0	Type S
0	1	1	1	Type T (IEC 584)
1	0	0	0	Type L (DIN 43710)
1	0	1	0	Voltage input: the input for thermoelements can be used for linear conversion of low voltages from -100 to +160 mV. In this case the rotary switches are used to adjust mV values while the slides switches operate with different range indications: S5 = 0: -100 to -1 mV or S5 = 1: 0 to +99 mV for the lower range; S6 = 0: 0 to +99 mV or S6 = 1: +100 to +160 mV for the upper range;
1	1	0	0	Pt100 or Ni100 components with 4-wire connection;
1	1	0	1	Pt100 or Ni100 components with 3-wire connection, observe bridge;
1	1	1	0	Pt100 or Ni100 components with 2-wire connection, observe bridge;
1	1	1	1	Line compensation: when using 2-wire connections, the line length resistance must be adjusted. Line compensation is also necessary when using thermo-elements with an external cold junction. For this it is necessary to short-circuit the measuring point and to select the code for line compensation as shown on the left. The Pwr and the ϟ LED flash alternately. Successful line compensation is indicated by mutual flashing of both LEDs. Please select a different function and remove the short-circuit.

Temperature Converters

IM34-11Ex-I

IM34-12Ex-Ri

Functions of slide switches **S5-S10** (IM34-12Ex-Ri: **S5-S13**):
The following functions can be selected with the switches:

- **S5** Lower range selection: selection of temperature range of low temp. valueTL
  S5 = 0: -100 to -1°C
  S5 = 1: 0 to +990°C
- **S6** Upper range selection: selection of temperature range of high temp. value T_H:
  S6 = 0: 0 to +990°C
  S6 = 1: +1000 to +1990°C
- **S7** output current during an error condition:
  If an input circuit error is detected, the output current is as follows
  S7 = 0: 0 mA
  S7 = 1: >22 mA
- **S8** output current range:
  S8 = 0: 0-20 mA
  S8 = 1: 4-20 mA
- **S9** Reference point compensation: when using thermoelements, reference point compensation is carried out as follows:
  - **externally** via 2-wire Ni100 or Pt100 in S9 = 0 or
  - **internally**: S9 = 1

  With **internal** reference point compensation, care must be taken that heat is conducted away from the housing. Heat accumulation can corrupt measuring data.
- **S10** resistor type: indication of the connected resistor type:
  S10 = 0: Pt100
  S10 = 1: Ni100

  With a voltage input or in case of thermoelement operation, the type of resistor does not have to be adjusted.

Referring to IM34-12Ex-Ri only:

- **S11, S12 and S13** Selection of switching threshold for limit value relay:
  S11 = 0: -100 to -1°C
  S11 = 1: >0°C

  Only if S11 = 1
  S12 = 0: 0 to +999°C
  S12 = 1: +1000 to +1990°C
  S13 Output performance of relay:
  S13 = 0: relay energized, if measuring value > switching threshold
  S13 = 1: relay energized, if measuring value < switching threshold

Mounting and Installation

The connected apparatus (Ni100/Pt100, thermoelements) must meet the requirements for use in explosion hazardous areas (EN60079-14). The device is suited for snap-on clamps for hat rail mounting (EN 50022) or for screw panel mounting. Devices **of the same type** may be mounted directly next to each other. It must be ensured that heat is conducted away from the device. Mounting and installation must be carried out in accordance with the applicable regulations. The removable terminal blocks are coded and may only be plugged into the designated sockets. The coding system may not be altered or damaged. The device must be protected against dust, dirt, moisture and other environmental influences as well as against strong electro-magnetic emissions. It should also be protected against the risks of mechanical damaging, unauthorized access and incidental contact. All installations must be carried out observing the regulations of EMC protection.

General information on use of devices with "IS" circuits

This device is equipped with circuits featuring protection type "intrinsic safety" for explosion protection per EN 50020 at terminals 1-6 which are marked in blue. The intrinsically safe circuits are approved by the authorised bodies for use in those countries to which the approval applies.

For **correct usage** in explosion hazardous areas it is required to **observe and follow** the **national regulations and directives strictly**. Following please find some guidelines referring to the framework directive of the European Union 94/9/EC (ATEX 100a).

This device is classified as an associated apparatus which is equipped with intrinsically safe and non-intrinsically safe circuits. Therefore it may not be installed in explosion hazardous areas. It is permitted to connect intrinsically safe equipment to the intrinsically safe connections of this device, provided the equipment complies with the regulations applying to use in the respective zone of the explosion hazardous area. When interconnecting devices within

IM34-11Ex-I

IM34-12Ex-Ri

such an assembly it is required to keep and provide a proof of intrinsic safety (EN 60079-14). Once that intrinsically safe circuits have been connected to the non-intrinsically safe circuit, it is not permitted to use the device subsequently as intrinsically safe equipment.

The governing regulations cover installation of intrinsically safe circuits, mounting to external connections, cable characteristics and cable installation. Cables and terminals with intrinsically safe circuits must be marked and separated from non-intrinsically safe circuits or feature appropriate isolation (EN 60079-14). It is required to observe the specified clearances between the intrinsically safe connections of this device and the earthed components and connections of other devices. The approval expires if the device is repaired, modified or opened by a person other than the manufacturer or an expert, unless the device specific instruction manual explicitly permits such interventions.

Visible damages of the device's housing (e. g. black-brown discoloration due to heat accumulation, perforation or deformation) indicate a serious error and the device must be turned off immediately. When using associated apparatus it is required to check the connected intrinsically safe equipment too. This inspection may only be carried out by an expert or the manufacturer. Operation of the device must conform to the data printed on the side of the housing.

Prior to initial set-up or after every alteration of the interconnection assembly it must be assured that the relevant regulations, directives and framework regulations are observed, that operation is error-free and that all safety regulations are fulfilled. Mounting and connection of the device should only be carried out by qualified and trained staff familiar with the relevant national and international regulations of explosion protection.

The **most important data from the EC type examination certificate** are listed overleaf. All valid national and international approvals covering **TURCK** devices can be downloaded from our website www.turck.com. Further information can be provided on request.

Short Description

- Inputs for Ni100 or Pt100 acc. to IEC 751, thermo-elements acc. to IEC 584 and for low voltages (mV range)
- Intrinsically safe input circuit EEx ia
- Area of application acc. to ATEX: II (1) GD
- Wire-break monitoring
- Short-circuit monitoring only of Pt100 or Ni100 components
- Galvanic isolation between input and output circuits and supply
- Analogue current output 0/4-20 mA
- Voltage proof up to 4 kV (IM34-11Ex-Ci/K51 only)
- Fast temperature measurement from a temperature gradient of 200 ìV/s (IM34-11Ex-Ci/K60 only)
- Limit value relay (IM34-12Ex-CRi only)
- Temperature linear conversion
- Parameterization via PC via programming adapter IM-PROG (to be ordered additionally – ident-no.: 6890422)
- Housing with coded and removable terminal blocks
- Simulation of outputs

Terminal Configuration

Intrinsically safe inputs at terminals 1–6

1, 2	thermoelement and mV input
3 – 6	Ni100 or Pt100 input
7, 8	analog current output (0/4-20 mA)
9, 10	Limit value relay (IM34-12Ex-CRi only)
11,12	supply voltage connection 20-250 VAC/20-125 VDC, <3 W

Connection via lifting cages with captive screws, connection profile:
≤1 x 2.5 mm², 2 x 1.5 mm² or 2 x 1 mm² with wire sleeves

Parameterization and Adjustments

The IM34… is parameterized and adjusted via the Device Type Manager (see also "PACT*ware*™ and devices DTM software installation"). The **TURCK** adapter IM-PROG is needed to establish the connection between the device and your PC.

For this it is necessary to connect the 3.5 mm connector to the measuring amplifier (PCConnect) and the RS232 connector to the serial interface of your PC. The following settings are available as an entry or numerical setting via the DTM:

- **Mode**
  Selection of the connection element: Pt/Ni100, thermo-element, mV input and selection of line compensation. The following settings depend on the selections made in the "Mode" menu:

  – Thermo-element
  Type selection: E, J, K, N, R, S, T, L, B

  – Connection Mode of Temperature Resistor
  2, 3 or 4-wire connection technology

  – Measuring Range
  The measuring range is composed of the lower and upper temperature value. After selecting the connecting type, the measuring range is indicated in the lower section of the DTM. These indications accord to the adjusted analogue output signal of 0/4-20 mA. The lower temperature depends on the type of thermoelement/temperature resistor and accords to an output signal of 0/4 mA. The upper limit temperature also depends on the type of thermo-element/temperature resistor. The adjusted upper limit temperature accords to an analogue output signal of 20 mA.

  – Output Signal
  The selection comprises 0-20 mA, 4-20 mA signals. The adjusted values correspond to the adjusted lower and upper limit temperatures.

  – Line Compensation
  In case of 2-wire connections, the resistor can be adapted to the connection cable. For this it is necessary to short the measuring point.

  The LEDs Pwr and ϟ flash alternately. If they start flashing mutually line compensation has been carried out. Continue by selecting another function and removing the short-circuit. If the LED ϟ continues to flash, line compensation has not been accomplished successfully. Line compensation must also be carried out if thermo-elements with external cold junction are used.

  – Error Current
  Either 0 mA or >22 mA

  – Switching Threshold (IM34-12Ex-CRi only)
  Entry of a temperature value or a low voltage value at which the limit value relay is activated.

Mounting and Installation

The connected apparatus (Ni100/Pt100, thermo-elements) must meet the requirements for use in explosion hazardous areas (EN 60079-14). The device is suited for snap-on clamps for hat rail mounting (EN 50022) or for screw panel mounting. Devices **of the same type** may be mounted directly next to each other. It must be ensured that heat is conducted away from the device. Mounting and installation must be carried out in accordance with the applicable regulations. The operator is responsible for compliance with the regulations. The removable terminal blocks are coded and may only be plugged into the designated sockets. The coding system may not be altered or damaged. The device must be protected against dust, dirt, moisture and other environmental influences as well as against strong electromagnetic emissions. It should also be protected against the risks of mechanical damaging, unauthorized access and incidental contact. All installations must be carried out observing the regulations of EMC protection.

Important information on use of devices with "IS" circuits

This device is equipped with circuits featuring protection type intrinsic safety for explosion protection per EN 50020 at terminals 1– 6 which are marked in blue. The intrinsically safe circuits are approved by the authorised bodies for use in those countries to which the approval applies.

For **correct usage** in explosion hazardous areas please **observe and follow** the **national regulations and directives strictly**. Following please find some guidelines referring to the frame-work directive of the European Union 94/9/EC (ATEX 100a).

This device is classified as an associated apparatus which is equipped with intrinsically safe and nonintrinsically safe circuits. Therefore it may only be installed in the non-explosion hazardous area in dry clean and well monitored locations. It is permitted to connect intrinsically safe equipment to the intrinsically safe connections of this device.

All electrical equipment must comply with the regulations applying to use in the respective zone of the explosion hazardous area. If the intrinsically safe circuits lead into explosion hazardous areas subject to dust hazards, i.e. zone 20 or 21, it must be ensured that the devices which are to be connected to these circuits, meet the requirements of category 1D or 2D and feature an according approval.

When interconnecting devices within such an assembly it is required to keep and provide a proof of intrinsic safety (EN 60079-14). Once that intrinsically safe circuits have been connected to the non-intrinsically safe circuit, it is not permitted to use the device subsequently as intrinsically safe equipment. The governing regulations cover installation of intrinsically safe circuits, mounting to external connections, cable characteristics and cable installation. Cables and terminals with intrinsically safe circuits must be marked and separated from nonintrinsically safe circuits or feature appropriate isolation (EN 60079-14). Please observe the specified clearances between the intrinsically safe connections of this device and the earthed components and connections of other devices.

The approval expires if the device is repaired, modified or opened by a person other than the manufacturer or an expert, unless the device-specific instruction manual explicitly permits such interventions.

Visible damages of the device's housing (e. g. black brown discoloration due to heat accumulation, perforation or deformation) indicate a serious error and the device must be turned off immediately. When using associated apparatus it is required to check the connected intrinsically safe equipment too. This inspection may only be carried out by an expert or the manufacturer.

Operation of the device must conform to the data printed on the side of the housing. Prior to initial set-up or after every alteration of the interconnection assembly it must be assured that the relevant regulations, directives and framework conditions are observed, that operation is error-free and that all safety regulations are fulfilled. Mounting and connection of the device may only be carried out by qualified and trained staff familiar with the relevant national and international regulations of explosion protection.

The **most important data from the EC type examination certificate** are listed overleaf. All valid national and international approvals covering **TURCK** devices are obtainable via the Internet (www.turck.com). Further information on explosion protection is available on request.

PACT*ware*™ and Devices DTM Software Installation

You will require the following software components on your computer for the installation of PACT*ware*:

- **PACT*ware* software for parameterizing of interface modules and *excom*®**
- **DTM**

These software components are available on the Internet at www.turck.com as a free-of-charge download.

- Select the homepage: www.turck-usa.com → Download → Software → Various Software

Your PC then requests the name of a directory at which it should save the files on the hard drive of your computer. The files are self-extracting archives, ZIP files, which extract independently when accessed.

- Simply double click on the ZIP archive to extract the files.
- You commence extraction of the file when you click on "Extract".

The "TURCK_FILES" directory is created on the current drive (e.g. C:\). Extract both file archives: (PACT*ware* and DTM) before you commence with the actual software installation.

1. Installation of PACT*ware*

Now start the installation of PACT*ware* on your computer.

- Start Windows Explorer and change over to the "TURCK_FILES\PACTware...SetupTurck\PACT*ware*" directory.
- Start the "setup.exe" file located there.

Follow the self-explanatory instructions displayed by the installation program and complete the installation.

2. Installation of the HART® Communication Driver

After the installation of PACT*ware* has been successfully completed, the HART communication driver must now be installed.

Start the "setup.exe" file located at "TURCK_FILES\...Dtms\Hart"

Follow the self-explanatory instructions displayed by the installation program and complete the installation.

3. Installing of the Devices DTM

After the installation of the HART communication driver been successfully completed, the devices DTM must be installed. A directory has been created to reflect the DTM which you have downloaded. The name commences with the first 4 or 5 letters of the device type which you have selected.

- Start for example "setup.exe" in the "TURCK_FILES\IM34...Setup...\" directory in order to install the devices DTM for the IM34.

Configuration of PACT*ware*

Please restart your PC after installation in order to update the Windows registry. Then open PACT*ware* and carry out configuration:

Make the following entries:

– User: "Administrator“
– Password: "manager“
Prior to parameterizing a device, a project has to be created. For this, please select the device catalogue from the "View“ menu or the < F3 > key. A new window with the name "Device catalogue" will open. This window contains all available "Device Type Managers - DTMs". Should a required DTM not be listed, please click on the button "Re-initialize the device catalogue"

- First add the HART protocol driver from the company Codewrights GmbH
- Then add the DTMs from **TURCK**

Parameter entries for HART protocol driver parameters:

(Open the window by a double click):
– Communication-Interface:
"HART Multiplexer“

– Select serial interface

– Baud rate: "9600“

⚠ Possible error sources:

– RS232 port not addressable or being used by another application, Remedy: use different port or exit the application causing problems

– RS232 line too long (max. line length approx. 10 m), Remedy: shorten line

After successful installation and configuration it is now possible to communicate with the IM34....

Analog Output Isolators

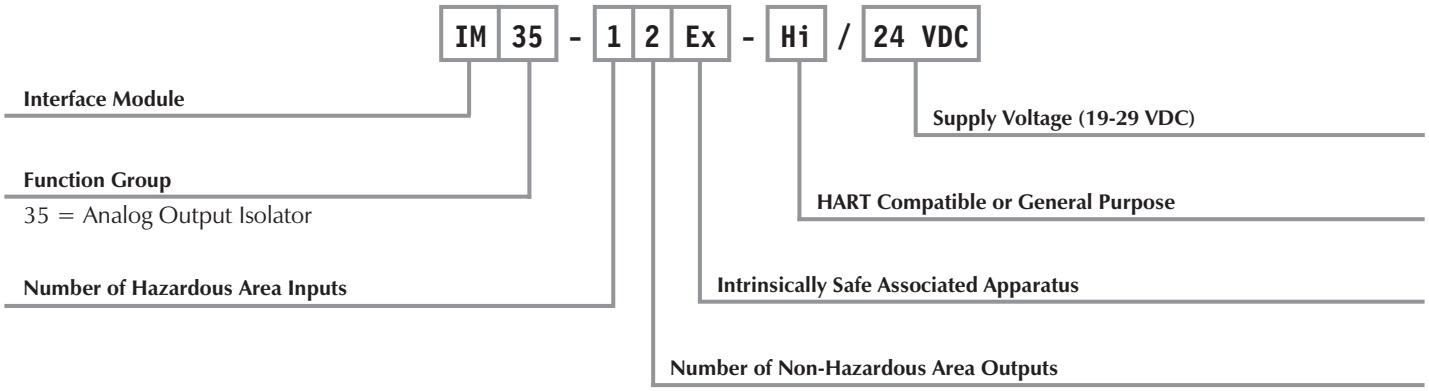
Analog output isolators are for use with conventional 0/4-20 mA or HART smart "IS" devices and are available in 1 and 2 channel versions. These devices are designed to provide a convenient way to transfer 0/4-20 mA signals, generated in a non-hazardous area, to a hazardous area intrinsically safe device, such as a valve positioner or I/P device.

HART capabilities allow bi-directional communications for HART devices if this function is being utilized. The same devices are also applicable for non-HART smart devices.

One device can be used for all applications of this type, which makes applying these devices simple. Stocking spares only requires one type of unit adding to the convenience.

Analog Input Repeaters/Supplies — Part Number Key

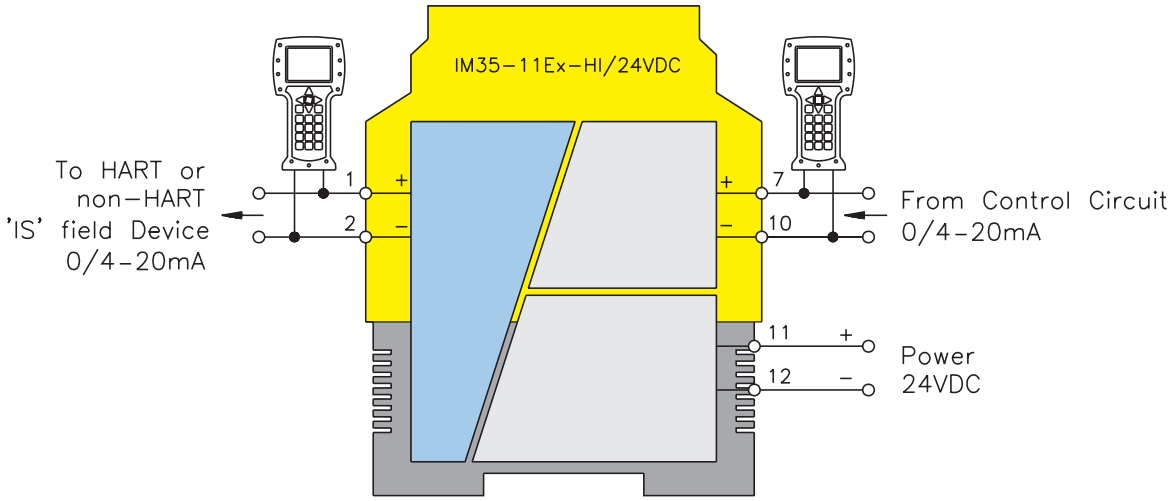
Part Number Keys are to assist in IDENTIFICATION ONLY. Consult factory for catalog items not identified.



Extension Examples:

IM35-11Ex-Hi/24 VDC
Interface Module
Analog Output Isolator
Single Channel Input
One Non-Hazardous Area Current Output
Intrinsically Safe Associated Apparatus
HART Compatible
24 VDC Supply Voltage

IM35-11Ex-Hi/24 VDC — Analog Output Isolators



Functional Description:

This single channel device will allow a controller in a non-hazardous area to provide a 1:1 transfer of a 0/4-20 mA signal to a device in a hazardous area. Valve controllers or I/P devices that are intrinsically safe, as well as signals that are "IS" originating from another non-hazardous area, may be accommodated. Bi-directional HART communications capability is also incorporated.

Features:

- 1 channel 0/4-20 mA current driver
- HART or non-HART compatible
- Allows bi-directional HART communications
- Facilities for non-hazardous area HART monitoring
- Linearity of less than 0.1%
- Temperature drift less than 0.01% /K

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage (19-29 VDC)

0-20 mA
24 mA can be transferred max load of 430 Ω
Input Resistance 110 Ω

Outputs: Non-Hazardous Area

0/4-20 mA (Load 600 Ω max.)

Relay: 250 VAC/120 VDC, 2A
500 VA/60 W 10Hz

For entity parameters see control drawings on pages B86 - B91.

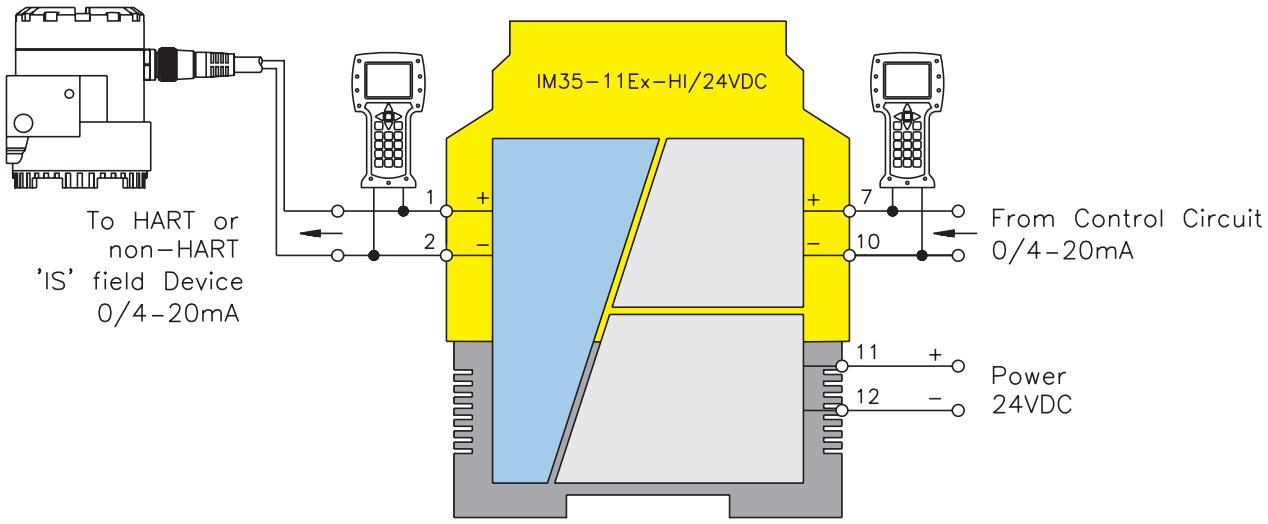
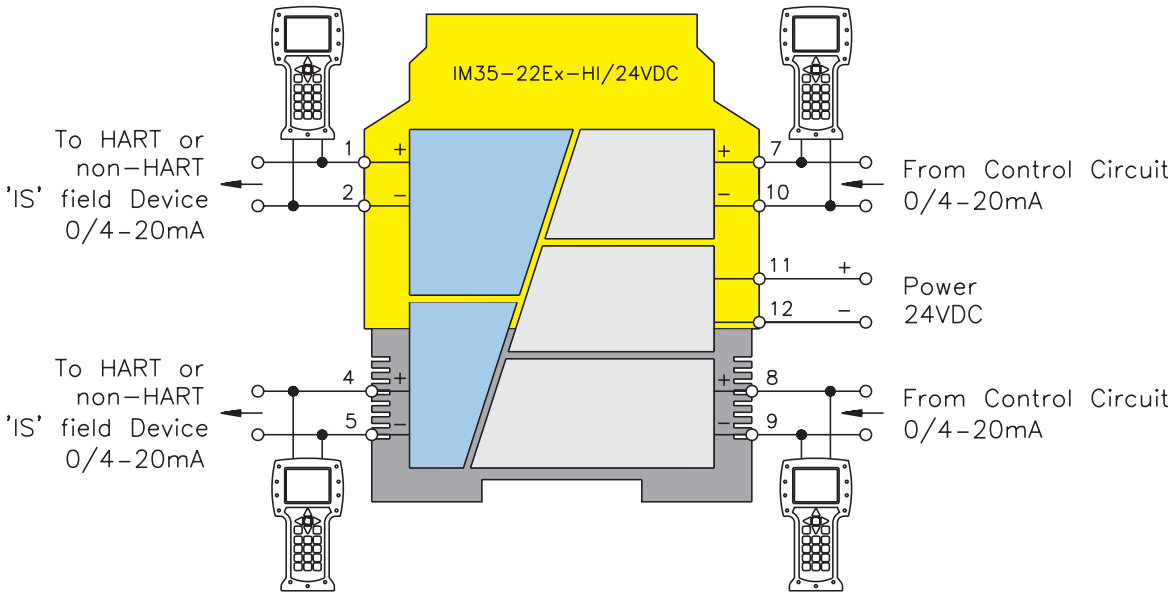
12	Module Power (-)



IM35-22Ex-Hi/24 VDC — Analog Output Isolators



Functional Description:

This dual channel device will allow a controller in a non-hazardous area to provide a 1:1 transfer of 2 separate 0/4-20 mA signals to two separate devices in the hazardous area. Valve controllers or I/P devices that are intrinsically safe, as well as signals that are "IS" originating from another non-hazardous area, or any combination of these signals, may be accommodated. Bi-directional HART communications capability is also incorporated for both channels.

Features:

- 2 channel 0/4-20 mA current driver
- HART or non-HART compatible
- Allows bi-directional HART communications
- Facilities for non-hazardous area HART monitoring
- Linearity of less than 0.1%
- Temperature drift less than 0.01% /K

Electrical Parameters:

Inputs: Hazardous Area

Supply Voltage (19-29 VDC)

0-20 mA
24 mA can be transferred max load of 430 Ω
Input Resistance 110 Ω

Outputs: Non-Hazardous Area

0/4-20 mA(Load 600 Ω max)

24 mA with a max load of 430 Ω
Load is 600 Ω max

For entity parameters see control drawings on pages B86 - B91.

Solenoid Driver/Discrete Output Isolators

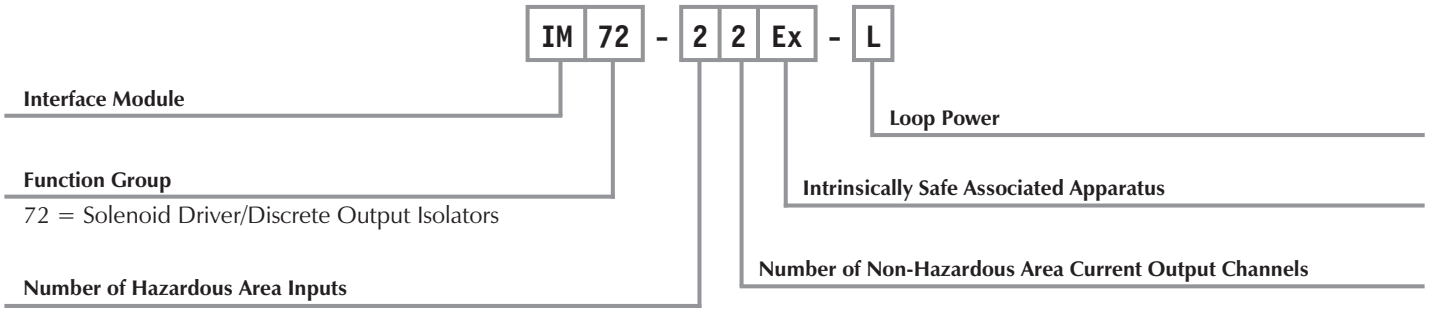
These loop powered "IS" interface devices provide power for "IS" solenoids in a hazardous area to be actuated from a controller in the non-hazardous area.

The IM72 solenoid drivers are uniquely designed devices that allow them to drive the vast majority of "IS" solenoids available in today's marketplace with a single type of interface device. Gone are the days when a wide variety of isolators were needed to drive specific solenoids with specific requirements. A single device will now allow you to use a single model for most applications, eliminating the need to do complicated and tedious calculations.

The design of these 1 and 2 channel devices make it extremely simple to choose the appropriate interface. Either choose a 1 channel or 2 channel interface, that's all there is to it. Stock can be significantly reduced, and installation and maintenance made easier. With a single unit for most applications, the IM72 makes choosing the appropriate interface as easy as it gets.

Solenoid Driver/Discrete Output Isolators — Part Number Key

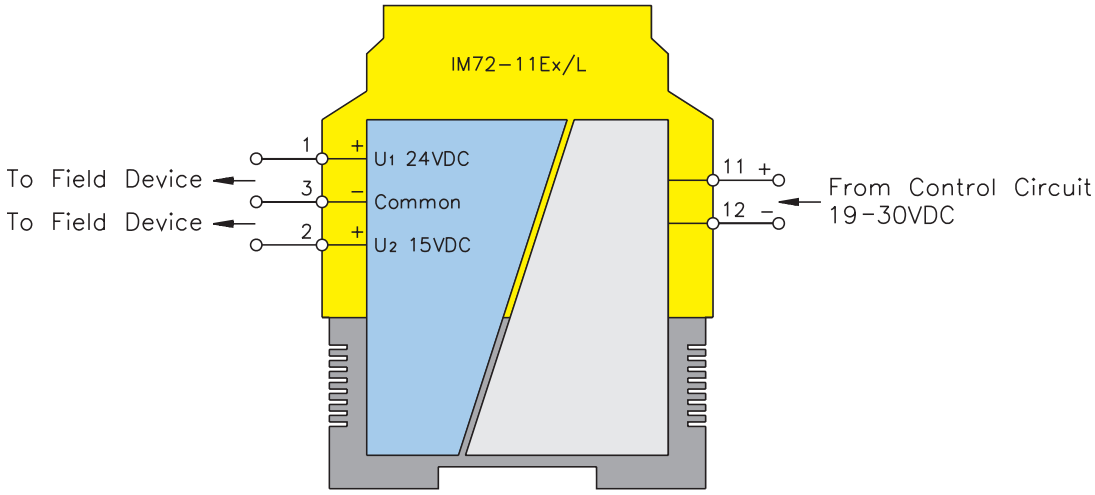
Part Number Keys are to assist in IDENTIFICATION ONLY. Consult factory for catalog items not identified.



Extension Examples:

IM72-22Ex/L
Interface Module
Solenoid Driver/Discrete Output Isolators
Two Input Channels
Two Non-Hazardous Area Current Outputs
Intrinsically Safe Associated Apparatus
Looped Power

IM72-11Ex/L — Solenoid Driver/Discrete Output Isolators



Functional Description:

This single channel device is designed to drive the vast majority of intrinsically safe solenoids available, as well as "IS" displays and other field devices that may require a separate "IS" power source. The unique design allows different configurations to be implemented depending on the specific field device being used.

Loop power is applied from a non-hazardous area source directly to the non-hazardous area inputs eliminating the requirement for additional power supply connections.

Features:

- 1 channel solenoid driver or "IS" supply
- Loop powered
- 2 output levels
- Switching frequency up to 500 Hz

Electrical Parameters:

Inputs: Hazardous Area

Supply (Loop Power)

Signal "OFF" . . . . . <5 V

Signal "ON" . . . . . 19-30 VDC

Switch-on delay . . . . . <400 µ

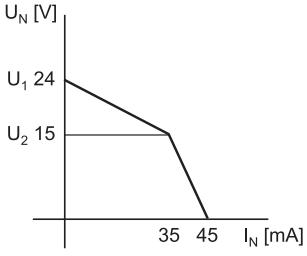
Outputs: Non-Hazardous Area

In accordance with Output Curve:

U1=24 V (Pins 1 & 3)
U2=15 V (Pins 2 &3)

I1= 45 mA (Pins 1 &3)
I2=45 mA (Pins 2 & 3)

Switching Frequency . . . . <500 Hz



For entity parameters see control drawings on pages B86 - B91.

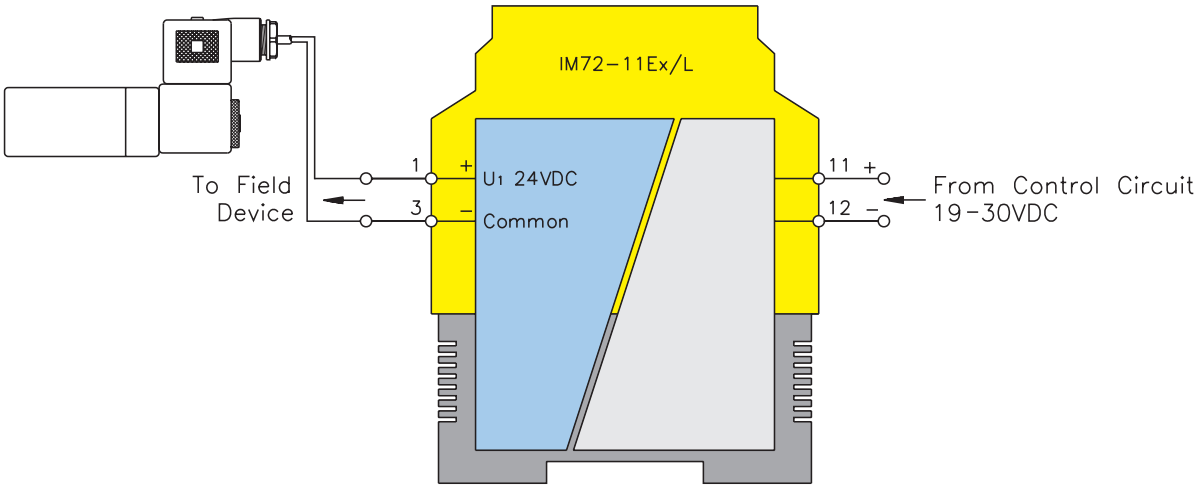
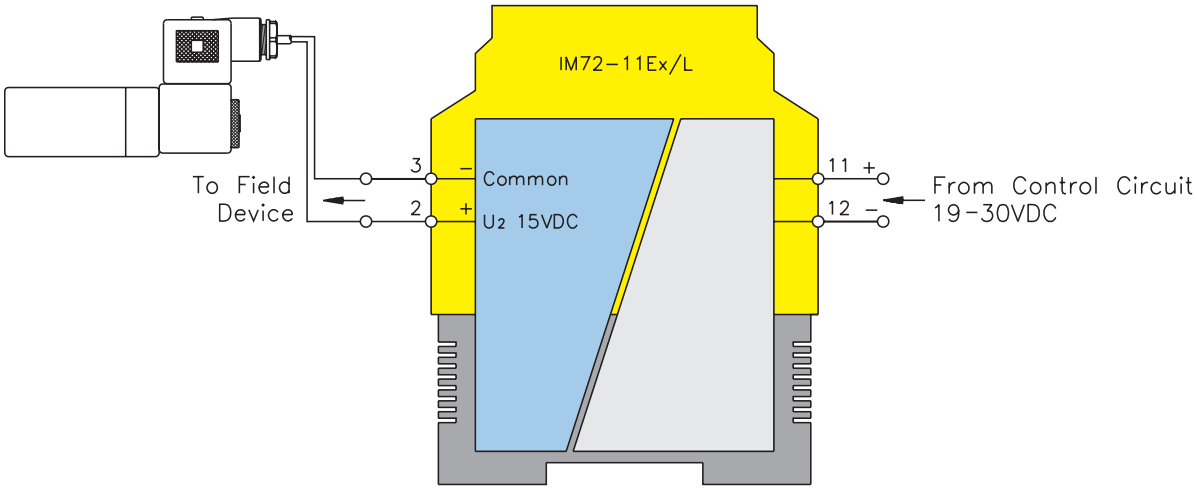
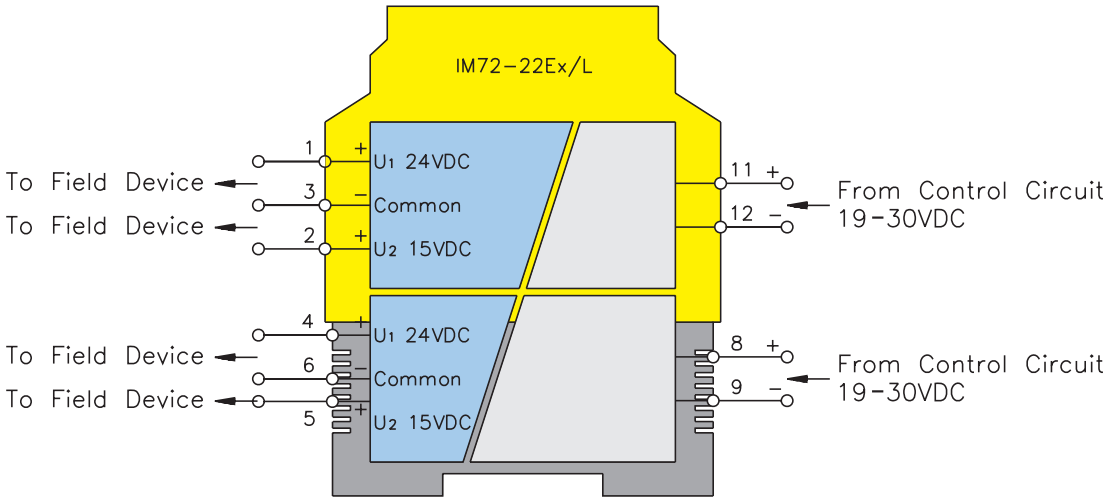
11	(+) Non-Hazardous Area Input
12	(-) Non-Hazardous Area Input





IM72-22Ex/L — Solenoid Driver/Discrete Output Isolators



Functional Description:

This dual channel device is designed to drive 2 separate intrinsically safe solenoids, "IS" displays or other field devices that may require a separate "IS" power source, or any combination of these devices. The unique design allows different configurations to be implemented depending on the specific field device or devices being applied.

Loop power is applied from a non-hazardous area source directly to the non-hazardous area inputs of each channel eliminating the requirement for additional power supply connections.

Features:

- 2 channel solenoid driver or "IS" supply
- 2 isolated loop powered circuits
- 2 output levels per channel
- Switching frequency up to 500 Hz

Electrical Parameters:

Inputs: Hazardous Area

Supply (Loop Power)

Signal "OFF" . . . . . <5 V

Signal "ON" . . . . . 19-30 VDC

Switch-on delay . . . . . <400 μ

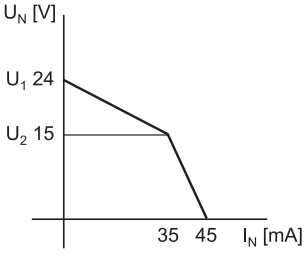
Outputs: Non-Hazardous Area

In accordance with Output Curve:

U1=24 V (Pins 1 & 3, 4 & 6)
U2=15 V (Pins 2 & 3, 5 & 6)

I1= 45 mA (Pins 1 & 3, 4 & 6)
I2=45 mA (Pins 2 & 3, 5 & 6)

Switching Frequency . . . . <500 Hz



For entity parameters see control drawings on pages B86 - B91.

Notes:

1. The symbol  designates third party approved with correct entity parameters meeting the relations shown in Table 1.
   - For US jurisdictions – Any FM approved intrinsically safe apparatus with Entity Concept parameters, or any simple apparatus.
   - For Canadian jurisdictions – Any Canadian certified intrinsically safe apparatus with Entity Concept parameters, or any simple apparatus.

   The Entity concept allows interconnection of intrinsically safe apparatus and associatedbpparatus not specifically examined in such combination as a system when the conditions above are met.

   $V_{max} \geq V_{oc}$ or V_t $\quad I_{max} \geq I_{sc}$ or I_t $\quad U_i \geq U_o$ $\quad I_i \geq I_o$ $\quad P_i \geq P_o$
   $C_i + C_{cable} \leq C_a$ $\quad L_i + L_{cable} \leq L_a$ $\quad C_i + C_{cable} \leq C_o$ $\quad L_i + L_{cable} \leq L_o$

   A simple apparatus is defined as an electrical component or combination of components of simple construction with well-defined electrical parameters that does not generate more than 1.5V, 100mA, and 25mW, or a passive component that does not dissipate more than 1.3W and is compatable with the intrinsic safety of the circuit in which it is used.

2. When the field device is a contact closure, the connection should be made as shown below for proper performance.

   IM1 models with line monitoring enabled  R1 should be 1kΩ to 2.2kΩ
   R2 should be 10kΩ to 22kΩ  IM12 models

4. Wiring methods must be in accordance with:
   - For US jurisdictions – the National Electrical Code, ANSI/NFPA 70, Article 504 (for Division installations) or Article 505 (for Zone applications), and ANSI/ISA RP12.06.01.
   - For Canadian jurisdictions – the Canadian Electrical Code, CSA 22.1, Appendix F.

5. Associated apparatus must not be connected to any device that uses or generates in excess of 250Vrms.

6. If the electrical parameters of the cable are unknown, the following values may be used:
   Capacitance – 60pF/foot,
   Inductance – 0.2μH/foot

IM31–22EX–.	1–2–3 4–5–6	7.2	1	0.3	13.5/240/240	1

Entity Parameters: Class I, Zone 0, 1, or 2
Output characteristic: Linear

Model	Terminals	U_o (V)	I_o (mA)	P_o (mA)	C_a(uF) IIC/IIB, IIA	L_a (mH) IIC, IIB, IIA
IM31–1.EX–.	1–2–3	7.2	1	0.3	13.5/240	1
IM31–22EX–.	1–2–3 4–5–6	7.2	1	0.3	13.5/240/240	1

Notes:

1. The entity concept allows interconnection of intrinsically safe apparatus and associated apparatus not specifically examined in combination as a system when the conditions below are met.

   $V_{max} \geq V_{oc}$ or V_t $\quad I_{max} \geq I_{sc}$ or I_t $\quad U_i \geq U_o$ $\quad I_i \geq I_o$ $\quad P_i \geq P_o$

   $C_i + C_{cable} \leq C_a$ $\quad L_i + L_{cable} \leq L_a$ $\quad C_i + C_{cable} \leq C_o$ $\quad L_i + L_{cable} \leq L_o$

2. A simple apparatus is defined as an electrical component or combination of components of simple construction with well–defined electrical parameters that does not generate more than 1.5V, 100mA, and 25mW, or a passive component that does not dissipate more than 1.3W and is compatable with the intrinsic safety of the circuit in which it is used.
3. Wiring methods must be in accordance with:
   For US jurisdictions – the National Electrical Code, ANSI/NFPA 70, Article 504 (for Division 1 or 2 installations) or Article 505 (for Zone 0, 1 or 2 applications), and ANSI/ISA RP12.06.01.
   For Canadian jurisdictions – the Canadian Electrical Code, CSA 22.1, for Division 1 or 2 or Zone 1 or 2 installations.
4. Associated apparatus must not be connected to any device that uses or generates in excess of 250Vrms unless it has been determined that the voltage is adequately isolated from the associated apparatus.
5. If the electrical parameters of the cable are unknown, the following default values may be used:
   Capacitance – 60pF/foot
   Inductance – 0.2uH/foot
6. WARNING: Substitution of components may impair intrinsic safety. AVERTISSEMENT: La substitution de composants peut compromettre la securite intrinseque.

For US jurisdictions – the National Electrical Code, ANSI/NFPA 70, Article 504 (for Division 1 or 2 installations) or Article 505 (for Zone 0, 1 or 2 applications), and ANSI/ISA RP12.06.01.

For Canadian jurisdictions – the Canadian Electrical Code, CSA 22.1, for Division 1 or 2 or Zone 1 or 2 installations.

4. Associated apparatus must not be connected to any device that uses or generates in excess of 250Vrms unless it has been determined that the voltage is adequately isolated from the associated apparatus.

5. If the electrical parameters of the cable are unknown, the following default values may be used:
Capacitance – 60pF/foot
Inductance – 0.2µH/foot

6. WARNING: Substitution of components may impair intrinsic safety. AVERTISSEMENT: La substitution de composants peut compromettre la securite intrinseque.

Notes:

1. The entity concept allows interconnection of intrinsically safe apparatus and associated apparatus not specifically examined in combination as a system when the conditions below are met.
   $V_{max} \geq V_{oc}$ or V_t $\quad I_{max} \geq I_{sc}$ or I_t $\quad U_i \geq U_o$ $\quad I_i \geq I_o$ $\quad P_i \geq P_o$
   $C_i + C_{cable} \leq C_a$ $\quad L_i + L_{cable} \leq L_a$ $\quad C_i + C_{cable} \leq C_o$ $\quad L_i + L_{cable} \leq L_o$
2. A simple apparatus is defined as an electrical component or combination of components of simple construction with well-defined electrical parameters that does not generate more than 1.5V, 100mA, and 25mW, or a passive component that does not dissipate more than 1.3W and is compatable with the intrinsic safety of the circuit in which it is used.
3. Wiring methods must be in accordance with:
   For US jurisdictions – the National Electrical Code, ANSI/NFPA 70, Article 504 (for Division 1 or 2 installations) or Article 505 (for Zone 0, 1 or 2 applications), and ANSI/ISA RP12.06.01.
   For Canadian jurisdictions – the Canadian Electrical Code, CSA 22.1, for Division 1 or 2 or Zone 1 or 2 installations.
4. Associated apparatus must not be connected to any device that uses or generates in excess of 250Vrms unless it has been determined that the voltage is adequately isolated from the associated apparatus.
5. If the electrical parameters of the cable are unknown, the following default values may be used:
   Capacitance – 60pF/foot
   Inductance – 0.2uH/foot
6. WARNING: Substitution of components may impair intrinsic safety. AVERTISSEMENT: La substitution de composants peut compromettre la securite intrinseque.

The BL20 Solution

The BL20 modular concept is a very flexible approach to terminal-wired I/O. The gateway, base and electronic modules provide many benefits to the user.

- The gateway provides communication between the fieldbus and I/O modules; modules are not dependent on the fieldbus protocol.
- DIN-rail mountable base modules are available with different wiring configurations to suit the user's needs.
- Electronic modules are hot swappable.
- Power distribution modules can be used to create isolated power segments within the system.

BL20's openness and flexibility provide a viable alternative to traditional PLC I/O.

Maximum Size of a BL20 Station

BL20 stations consist of a gateway and a maximum of 74 I/O modules (equivalent to 1 m station length). Some high-tech and analog I/O modules may consume or produce large amounts of data, and therefore may further limit the number of modules that may be used. It is highly recommended that I/O*assistant* software is used when planning and commissioning BL20 systems. This program allows you to build the BL20 node on your computer and verify that all restrictions with regard to power and size are met. The free I/O*assistant* software is available to download from www.turck.com.

Addressing

As a node on a network, the BL20 station must have an address. The setting of this address is dependent on the network system being used. Each network gateway has a set of rotary switches (one for the most significant digit, or 10's multiplier, and one for the least significant digit, or 1's multiplier) that are used to set the address for the node. DeviceNet™ gateways may be addressed between 0 and 63, while PROFIBUS®-DP and CANopen gateways can be set from 0 to 99.

BL20 Power Distribution

The power supply for a BL20 station is fed via power feeding or bus refreshing modules; the latter also being responsible for the power supply to the internal module bus. Bus refreshing modules are used within a BL20 station (without gateway supply) if the system supply to the BL20 modules (nominal current IMB 1.5 A) is no longer sufficiently guaranteed. Bus refreshing modules are used with tension clamp (BL20-P3T-SBB-B or BL20-P4T-SBBC-B) or screw connection base modules (BL20-P3S-SBB-B or BL20-P4S-SBBC-B). Power feeding modules are used if the system supply to the BL20 modules (nominal current IL < 10 A) is no longer sufficiently guaranteed.

System Supply Via Module Bus

The amount of BL20 modules that may be supplied by a bus refreshing module via the internal module bus depends on the respective minimal current IMB of the individual modules on the bus. The sum of the nominal current inputs of the connected BL20 modules must not exceed 1.5 A. BL20 gateway power requirements (supplied by the first bus refreshing module) should be considered when calculating the required number of bus refreshing modules. If I/O*assistant* software is used, an error message is generated automatically via the <Station - Verify> as soon as the system supply is no longer sufficiently guaranteed.

All bus refreshing modules used in a BL20 station should be connected via the same frame potential. The power supply to the bus is fed via the connections 11 (plus) and 21 (ground) of the respective base module for the bus refreshing module.

Creating Potential Groups

Both bus refreshing modules and power feeding modules may be used to create a potential group. The base module creates the possible isolation of the potential group on the left-hand side of the respective power distribution module.

It is not permitted for modules with 24 VDC and with 120/230 VAC field supply to be used in a joint potential group. Therefore, when using digital input modules for 120/230 VAC, the power feeding module BL20-PF-120/230VAC-D is to be used to create a special potential group.

C-rail (Cross Connection)

C-rails run through all I/O base modules. The C-rail for base modules for power distribution is mechanically separated; thus potentially isolating the adjoining supply groups.

Access to the C-rail

Access to the C-rail is made via base modules with a C designation (i.e. BL20-S4T-SBCS). The corresponding connection level is indicated by a thick black line on all base modules for BL20 I/O modules. For base modules for power distribution, the black line is only above the connection “24" to indicate that the C-rail is separated from the adjoining potential group to its left.

It is permitted to load the C-rail with a maximum of 24 V; never with 120/230 VAC.

Using the C-rail with Relay Modules

The C-rail may be used to supply a common voltage when relay modules are used. To accomplish this, the load voltage (24 VDC) is connected to a power distribution module and the base module BL20-P4x-SBBC with either tension clamp or screw connections.

If the C-rail is used for the joint supply of voltage to relay modules, there must be a power distribution module used for the potential isolation of the BL20 modules. The C-rail may still be used as protective earth (PE) once the potential isolation has been made.

Using the C-rail as a Protective Earth

A C-rail may be used as a protective earth (PE), where the PE connection for each power distribution modules must be connected to the mounting rail via an additional PE terminal, which is available as an accessory.

Environmental Conditions

General Technical Data

Potential Isolations	Via Optocoupler
Ambient Temperatures	
Operating Temperature	+32 to +131°F (0 to +55°C)
Storage Temperature	-13 to +185°F (-25 to +85°C
Relative Humidity	5 to 95% (indoor), Level RH-2, without condensation (storage at 45°C)
Noxious Gas	
SO2	10 ppm (rel. humidity <75%, without condensation)
H2S	1.0 ppm (rel. humidity <75%, without condensation)
Shock and Vibration	
Resistant to Vibration	According to EN 61131
Operating Conditions	According to EN 61131
Resistant to Shock	According to IEC 68-2-27
Topple and Fall	According to IEC 68-2-31 and free fall according to IEC 68-2-32
Protection Class	IP 20
Electromagnetic Compatibility (EMC)	According to EN 50 082-2 (Industry)
Tests	According to EN 61131-2
Base Modules	
Measurement Data	According to VDE 0611 part 1/8.92 / IEC 947-7-1/1989
Connection to Technology in TOP Construction	Tension clamp or screw connection
Insulation Stripping Length	8 mm
Crimpable Wire	
Nominal Diameter	1.5 mm^2
"e" solid core H 07V-U	0.5 to 2.5 mm^2
"f" flexible core H 07V-K	0.5 to 1.5 mm^2
"f" with ferrules	According to DIN 46 228/1 (ferrules crimped gas-tight), 0.5 to 1.5 mm^2
Plug Gauge	According to IEC 947-1/1988, A1
Protection Class	IP 20
Approvals	CE, UL, CSA

DeviceNet Gateway

BL20-GWBR-DNET

- **Modular I/O**
- **Fieldbus Independent Configuration**
- **IP 20 Protection**
- **Various I/O Styles**

Electrical

- Operating Current: <250 mA from BR power supply
- Supply Current: <10 A to I/O (from U_L)
  <1.5 A to backplane (from U_{SYS})

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20
- Vibration: 1 g @ 5-100 Hz

Material

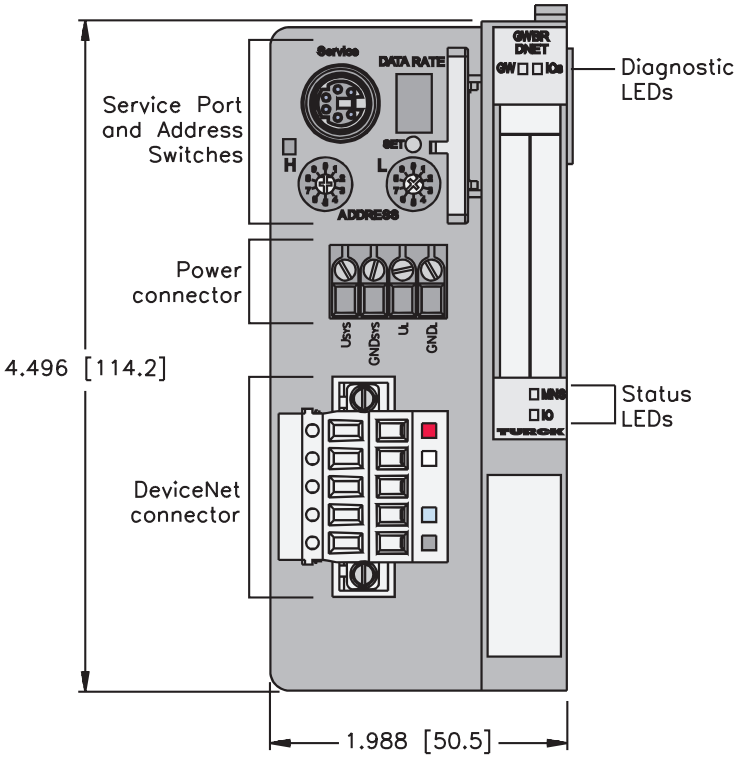
- Housing: PC-V0 (Lexan)

Diagnostics (Logical)

- Diagnostic information available through the DeviceNet I/O map

Diagnostics (Physical)

- LEDs to indicate status of DeviceNet and Module Bus communication



DeviceNet Connector

BL20-4DO-24VDC-0.5A-P

Electrical

- Operating Current: <33 mA from V_{MB}
  <25 mA from V_{IO} (...-0.5A...)
  <50 mA from V_{IO} (...-2A...)
- Output Current: see table on facing page (from V_{IO})

Power Distribution

- Outputs: V_{IO}
- Logic: V_{MB} and V_{IO}

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20

Diagnostics (Logical)

- Diagnostic information available through the fieldbus gateway

Diagnostics (Physical)

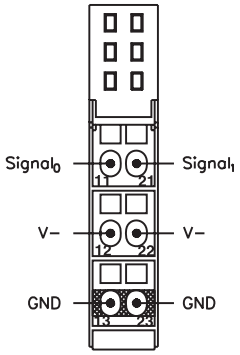
- LED to indicate module bus communication status as well as I/O diagnostics
- LEDs for each I/O point to indicate on/off status

	Outputs					Data
Part Number	Input Count	Pinout	Current	Individual Diagnostics	Wire-Break Detection	I/O Map
BL20-2DO-24VDC-0.5A-P with BL20-S3*-SBC**	4	B20-3B	0.5 A			1
BL20-2DO-24VDC-0.5A-N with BL20-S3*-SBC**	4	B20-3B	0.5 A			1
BL20-2DO-24VDC-2A-P with BL20-S3*-SBC**	4	B20-3B	2 A			1
BL20-4DO-24VDC-0.5A-P with BL20-S6*-SBCSBC**	4	B20-6B	0.5 A			2

* T = Tension clamp
S = Screw clamp
** Base modules sold separately. See pages C56 - C60.

Output Connectors

B20-3B



B20-6B

Discrete relay Output Modules

BL20-2DO-R-CO
BL20-2DO-R-NO
BL20-2DO-R-NC

- **Modular I/O**
- **Fieldbus Independent Configuration**
- **IP 20 Protection**
- **Relay Outputs**

Electrical

- Operating Current: <28 mA from V_{MB}
  <20 mA from V_{IO}

Power Distribution

- Outputs: V_{IO}
- Logic: V_{MB} and V_{IO}

Mechanical

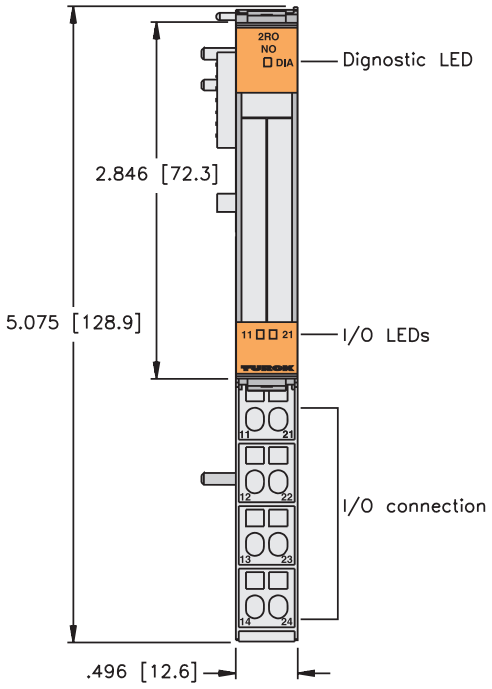
- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20

Diagnostics (Logical)

- Diagnostic information available through the fieldbus gateway

Diagnostics (Physical)

- LED to indicate module bus communication status as well as I/O diagnostics
- LEDs for each I/O point to indicate on/off status

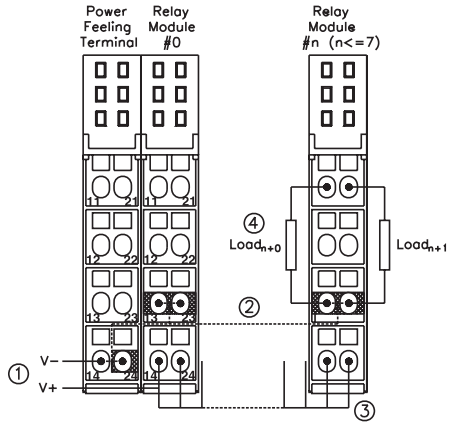


Part Number	Outputs: Count	Outputs: Pinout	Outputs: Current	Outputs: Individual Diagnostics	Outputs: Wire-Break Detection	Data: I/O Map
BL20-2DO-R-NO with BL20-S4*-SBCS**	2	B20-4A	2 A			1
BL20-2DO-R-NC with BL20-S4*-SBCS**	2	B20-4A	2 A			1
BL20-2DO-R-CO with BL20-S4*-SBBS**	2	B20-4B	2 A			1

* T = Tension clamp
  S = Screw clamp
** Base modules sold separately. See pages C56 - C60.

Output Connectors

B20-4A



① Power is supplied by the user.

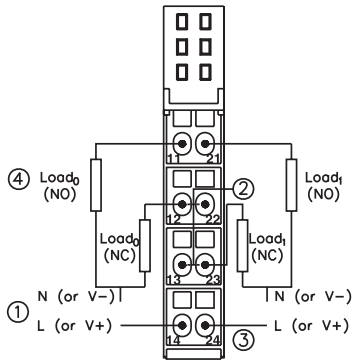
② V– terminal points connected internally via "C–Rail"

③ V+ terminal points connected externally by user (jumper part number XN–QV/*, "*" indicates number of slices to connect, up to 8)

④ Relay$_0$ contact is between terminals 14/11
Relay$_1$ contact is between terminals 24/21

*NOTE: C–Rail scheme may only be used with 24 VDC relays. Not rated for AC use.

B20-4B



① Power is supplied externally by the user.

② Terminal points 12/22 connected internally.
Points 13/23 connected internally.

③ Terminal points 14/24 may be connected externally by user (jumper part number XN–QV/1).

④ Relay$_0$ (NO) contact is between terminals 14/11,
(NC) contact between 24/21.
Relay$_1$ (NO) contact is between terminals 24/21,
(NC) between 24/23.

I/O Data Map 1

Temperature Input Modules

BL20-2AI-THERMO-PI
BL20-2AI-PT/NI-2/3

- **Modular I/O**
- **Fieldbus Independent Configuration**
- **IP 20 Protection**
- **Thermocouple or RTD Inputs**

Electrical

- Operating Current: <45 mA from V_{MB}
  <30 mA from V_{IO}
- Thermocouple Types: B, E, J, K, N, R, S, T (... THERMO-PI)
- RTD Types: PT100, PT500, PT1000, Ni100, Ni1000 (...PT/Ni-2/3)

Power Distribution

- Inputs: V_{IO}
- Logic: V_{MB} and V_{IO}

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20

Diagnostics (Logical)

- Diagnostic information available through the fieldbus gateway

Diagnostics (Physical)

- LED to indicate module bus communication status as well as I/O diagnostics

Serial I/O Modules

BL20-1RS232
BL20-1SSI
BL20-1RS485/422

- **Modular I/O**
- **Fieldbus Independent Configuration**
- **IP 20 Protection**
- **Various I/O Styles**

Electrical

- Operating Current: <25 mA from V_{IO}
  <140 mA from V_{MB} (...1RS232)
  <50 mA from V_{MB} (...1SSI)
  <60 mA from V_{MB} (...1RS485/422)

Power Distribution

- I/O: V_{IO}
- Logic: V_{MB} and V_{IO}

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20

Diagnostics (Logical)

- Diagnostic information available through the fieldbus gateway

Diagnostics (Physical)

- LED to indicate module bus communication status as well as I/O diagnostics
- LEDs for each I/O point to indicate on/off status

Counter Module

BL20-1CNT-24VDC

- **Modular I/O**
- **Fieldbus Independent Configuration**
- **IP 20 Protection**
- **Counter Input**

Electrical

- Operating Current: <50 mA (from V_{IO})
  <40 mA (from V_{MB})
- Count Range: 0...7FFFFFFF (positive)
  80000000...FFFFFFFF (negative)

Power Distribution

- Inputs: V_{IO}
- Logic: V_{MB} and V_{IO}

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20

Diagnostics (Logical)

- Diagnostic information available through the fieldbus gateway

Diagnostics (Physical)

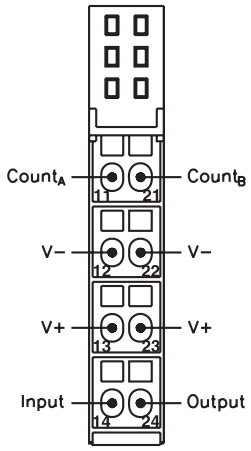
- LED to indicate module bus communication status as well as I/O diagnostics
- LEDs for each I/O point to indicate on/off status

	Inputs							Data
Part Number	Input Count	Pinout	Style	Group Diagnostics	Individual Diagnostics	Wire-Break Detection	I/O Map	
BL20-1CNT-24VDC with BL20-S4*-SBBS**	1	B20-4K	Counter				See below	

* T = Tension clamp
  S = Screw clamp
** Base modules sold separately. See pages C56 - C60.

Input Connectors

B20-4K



NOTE: "Input" signal serves several uses (gate, sync, etc)

I/O data map is dependant on the fieldbus being used. Consult the user manual for details.

Power Feeding Modules

BL20-PF-120/230VAC-D
BL20-PF-24VDC-D

- **Modular I/O**
- **Fieldbus Independent Configuration**
- **IP 20 Protection**
- **Supply AC or DC I/O Power**

Electrical

- Operating Current: <28 mA (from V_{MB})
- Output Current: <10 A for downstream I/O

Power Distribution

- Accepts AC (...120/230VAC...) or DC (...24VDC...) supply to provide V_{IO} for downstream modules

Mechanical

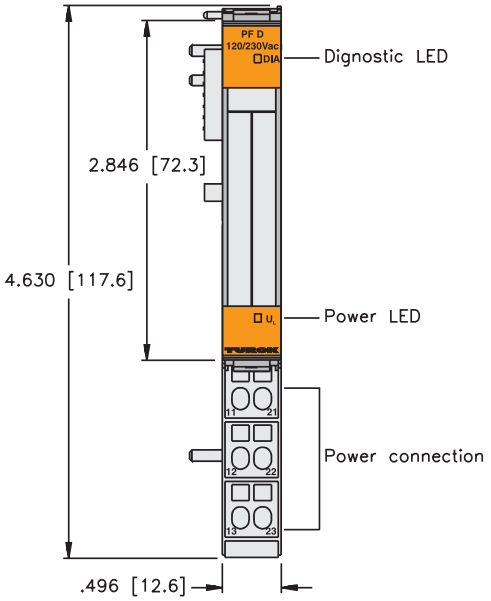
- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20

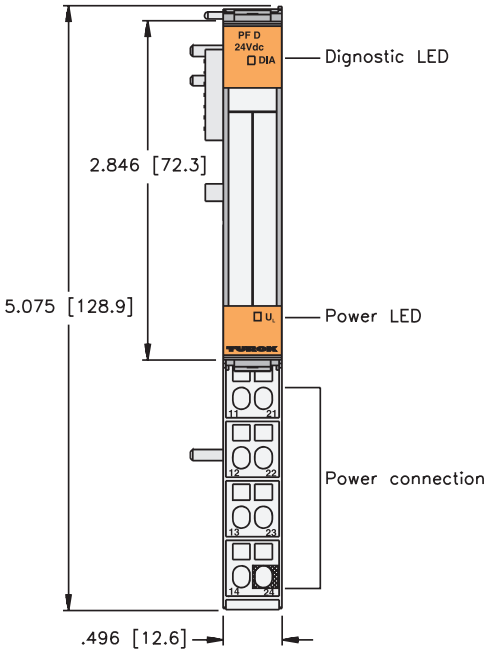
Diagnostics (Logical)

- Diagnostic information available through the fieldbus gateway

Diagnostics (Physical)

- LED to indicate module bus communication and power supply status.



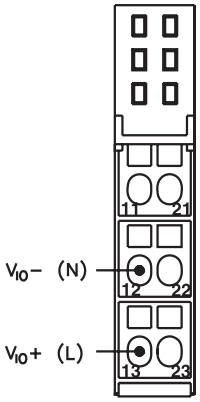


Part Number	Pinout
BL20-PF-120/230VAC-D with BL20-P3*-SBB**	B20-P3
BL20-PF-120/230VAC-D with BL20-P4*-SBBC**	B20-P4
BL20-PF-24VDC-D with BL20-P3*-SBB**	B20-P3
BL20-PF-24VDC-D with BL20-P4*-SBBC**	B20-P4

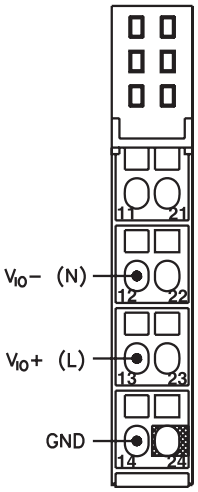
* T = Tension clamp
  S = Screw clamp
** Base modules sold separately. See pages C56 - C60.

Input Connectors

B20-P3



B20-P4



Bus Refreshing Module

BL20-BR-24VDC-D

- **Modular I/O**
- **Fieldbus Independent Configuration**
- **IP 20 Protection**

Electrical

- Module Bus Supply: <1.5 A
- I/O Supply: <10 A (24 VDC only)

Power Distribution

- Refreshes backplane (V_{MB}) supply and provides new V_{IO} segment for downstream modules

Mechanical

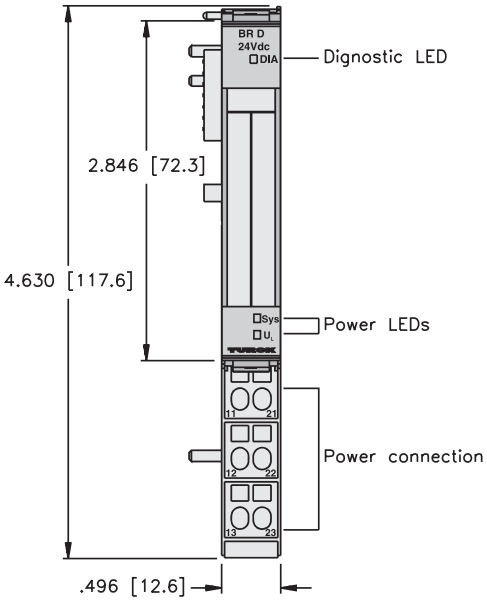
- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20

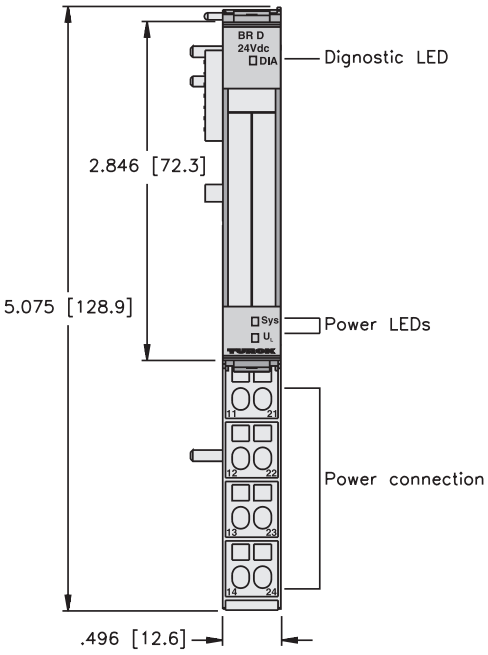
Diagnostics (Logical)

- Diagnostic information available through the fieldbus gateway

Diagnostics (Physical)

- LED to indicate module bus communication and power supply status.



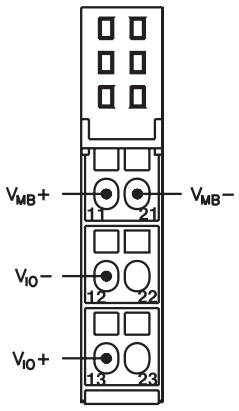


Part Number	Pinout
BL20-BR-24VDC-D with BL20-P3*-SBB-B**	B20-P3A
BL20-BR-24VDC-D with BL20-P4*-SBBC-B**	B20-P4A

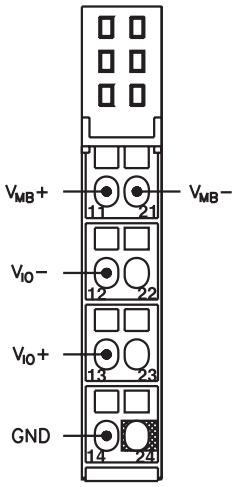
* T = Tension clamp
  S = Screw clamp
** Base modules sold separately. See pages C56 - C60.

Input Connectors

B20-P3A



B20-P4A



BL20 Motor Starter Modules

BL20 motor starters allow 3-phase motor control to be connected to the same BL20 rack as the standard I/O. BL20 motor starters can be mounted on the same rail as the BL20 gateway, or they can be mounted on another rail to ease placement within panels. The motor starters will be controlled by the gateways via the chosen fieldbus (DeviceNet, PROFIBUS-DP, or CANopen).

How to Order a Motor Starter

PKZM0-1 +  **PKZM0-XDM12** +  **DILM7-10 (24 VDC)** +  **BL20-SWIRE-DIL** = 

How to Implement the Motor Starters

Each SWIRE slice can manage up to 16 non-reversing motor starters.

Each gateway can support up to 3 SWIRE modules for a total of 48 non-reversing motor starters on a single gateway. Any reversing motor starter is considered as 2 non-reversing. The motor starters are rated for .06kW to 15kW (0.08hp to 20hp).

By ordering parts of the motor starter separately will allow for fewer parts to be stored within your inventory and will cost less to repair if just one piece of the motor starter fails. Motor starters are hot-swappable as long as the SWIRE-DIL module stays connected to the SWIRE system.

Refer to the user manual for details on installing and configuring the BL20 motor starter system.

Available Motor Starter Sizes

Part Number	Motor Rating @ 480 VAC		Rated Operational Current @ 480 VAC	Rated Uninterrupted Current @ 480 VAC	Classification Type
	kW	hp			
PKZM0-0.25	0.06	0.08	0.21	0.25	2
PKZM0-0.4	0.09	0.12	0.31	0.4	2
PKZM0-0.63	0.18	0.24	0.6	0.63	2

* To order a motor starter with the rated hp, order one of each part number that appears to the right.

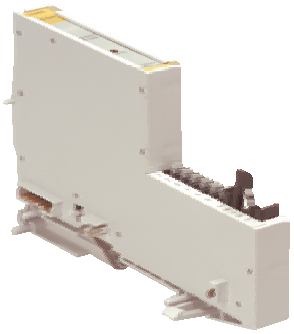
SWIRE Economy Communication Module



BL20-E-1SWIRE

- **Modular Motor Starter Control**
- **Fieldbus Independent Configuration**
- **IP 20 Protection**
- **Base and Electronics in One Part**

Electrical

- Operating Current: ≤60 mA from V_{MB}
  <3 A from V_{IO}

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20

Diagnostics (Logical)

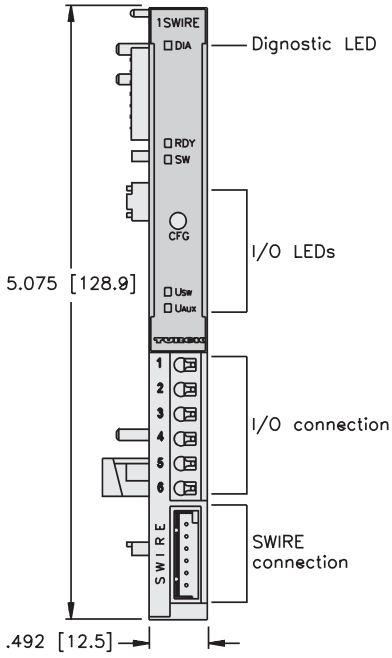
- Diagnostic information available through the fieldbus gateway

Diagnostics (Physical)

- LEDs for status and I/O diagnostics

Supported Gateways

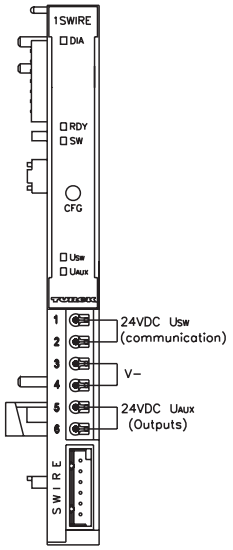
- BL20-GW-DPV1
- BL20-GWBR-CANopen
- BL20-GWBR-DNET



Part Number	Input Count	Pinout	Current	Group Diagnostics	Individual Diagnostics	Wire-Break Detection	I/O Map
BL20-E-1SWIRE		1	3 A	X	X		1

Note: This module can only be used with other tension clamp modules unless it is separated using a BL20-PF-24VDC-D and BL20-P4T-SBBC base.

1



Mating Cordsets:

From SWIRE slice to first motor starter: BL20-SWIRE-CAB-XXX.

End cap for last motor starter; BL20-SWIRE-CAB-000

From one motor starter to an adjacent motor starter: BL20-SWIRE-CAB-008

XXX = Cable length in cm, cable lengths available in 25, 50, 100 and 200 cm.

Motor Overload Contactor

- **Protects Motor from Current Overload**

Housing	Part Number	Application
	PKZM0-*	• Available in multiple amperages • See table on page C50 for Specs.

Motor Starter Wiring Set

- **Wires Motor Overload Contactor to Relay Module**

Housing	Part Number	Application
	PKZM0-X*M*2	• Different styles for different amperages • See tables on C51 & C52 for correct part numbers

Relay Module

- **Controls whether or not Power is Supplied to Connected Motor**

Housing	Part Number	Application
	DILM*	• Available in different styles for different amperages • See pages C51 & C52 for correct part numbers • "10" in part number refers to normally open contact • "01" in part number refers to normally closed contact

SWIRE Communication

- **Controls SWIRE Communication and Activates the Motor Starter**

Housing	Part Number	Application
	BL20-SWIRE-DIL	• Use with all DILM* modules • Control motor starter through SWIRE network

Trip Indication

- **Provide Feedback Status of Motor Starter because of Overcurrent or Short Circuit**

Housing	Part Number	Application
	NHI-E-10L-PL20	• Monitor motor starter status

Bus Commoning Bars

- **Easily Connect Multiple Motor Starters without the need for Separate Wiring**

Housing	Part Number	Application
	BK25/3-PKZ0 B3.0/2-PKZ0* B3.0/4-PKZ0* B3.0/5-PKZ0*	• BK25 is used to land 3 phase wires to beginning of the bus • B3.0/x; x refers to the number of motor starters can be connected to the bar • Max 63A can be carried through a bus bar

* If bussing a reverse motor starter, a cover may be necessary for finger safe needs. Order a cap with p/n H-B3-PKZ0.

Power Feed Module

- **Safety Zone Separation**

Housing	Part Number	Application
	BL20-SWIRE-PF	• Separate motor starter sets into separate safety zones

Base Modules for Slice I/O

The *excom*® System

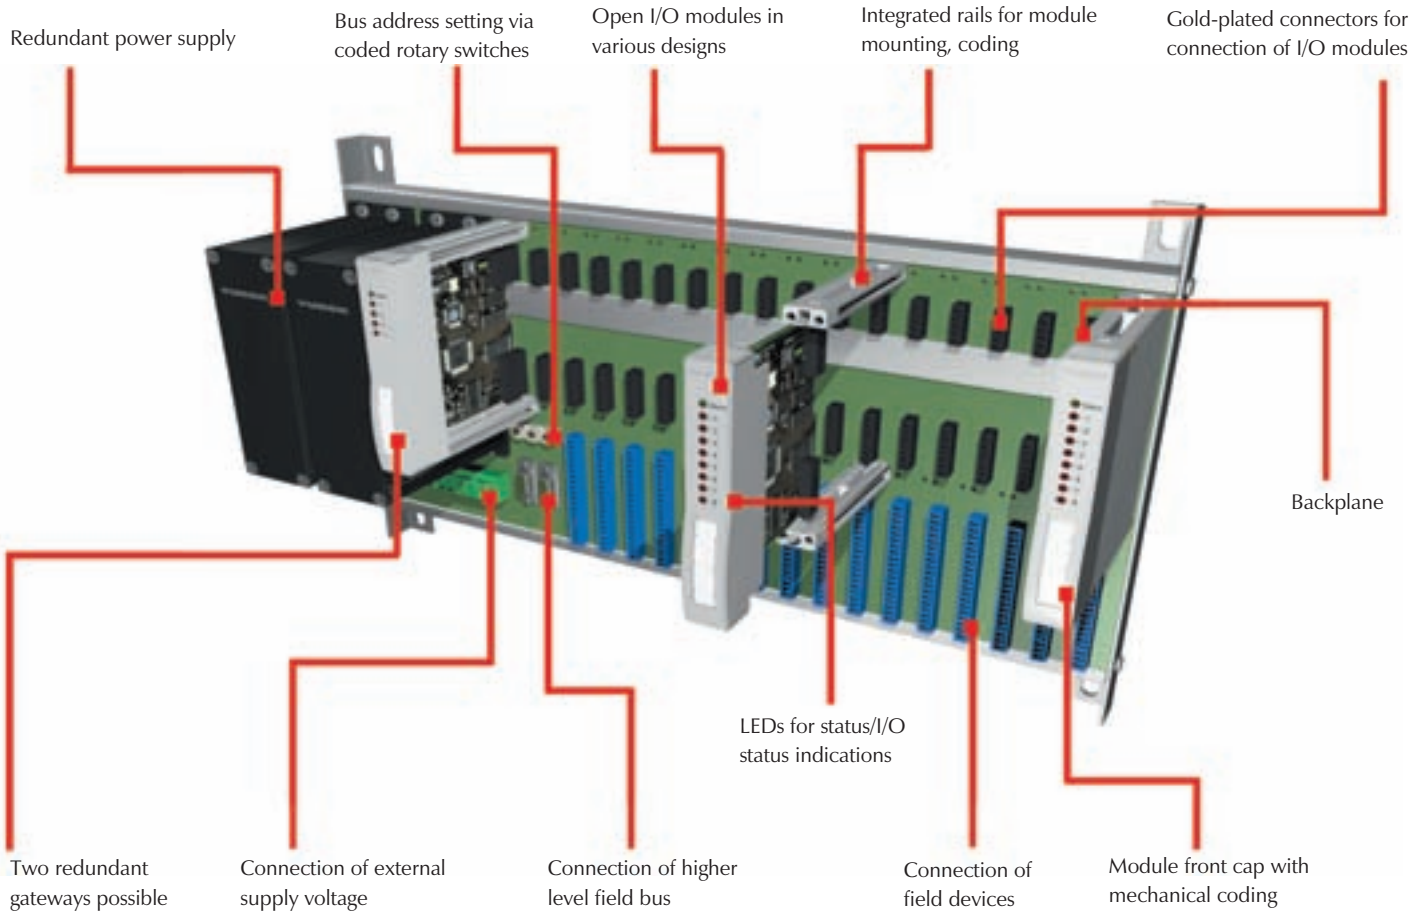
excom is a remote I/O system for use in hazardous locations. It provides PROFIBUS®-DP compatible I/O modules in an IP 20 protected solution for connecting discrete and analog intrinsically safe field devices. It is approved for use in Class I, Division 2 locations, and may be connected to field devices in Class I, Division 1 areas.

The modular system consists of power modules, PROFIBUS-DP communication gateways, I/O modules and a backplane rack. The backplane is available in two sizes, with support for 8 or 16 I/O modules. The larger rack (MT18…) also allows for redundant power supplies and PROFIBUS-DP gateway cards to be used. This allows a failsafe communication scheme to be used.

The I/O modules provide the interface to field devices. The backplane provides power for I/O from the mounted power supply, with no need for a separate field supply. The gateways, power supplies and I/O cards are simply plugged into the backplane rack, with all power, PROFIBUS-DP and I/O wiring separate from the removable modules. I/O modules may also be changed during operation ("hot-swapped"). The system automatically checks whether a newly inserted module matches the configuration.

The internal cycle time of the excom system is less than 5 ms for discrete signals and less than 20 ms for analog signals. Total response time of the PROFIBUS-DP system depends on the cycle time of the controller and its program, as well as the data rate of the PROFIBUS-DP system. HART values may be exchanged with supported devices via PROFIBUS-DPV1 communication.

In order to use the excom system in a hazardous area, the PROFIBUS-DP communication must be conditioned through a segment coupler. Couplers are available for both wire and fiber-optic media.



Diagnostics

The ***excom*** gateway provides extended PROFIBUS-DP diagnostic information, including channel-specific error indication. Each module also features LEDs for visual error indication as well as I/O status. Consult the user manual for the ***excom*** system for detailed information.

Addressing

The I/O modules need no user configured address since the gateway recognizes them by which backplane slot they are inserted in. The ***excom*** system itself needs a PROFIBUS-DP address, which is set via three rotary switches. The maximum address of the system is 125.

PROFIBUS-DP Gateway

- **Modular I/O**
- **PROFIBUS-DP Compatible**
- **Hazardous Area Usage**
- **Various I/O Styles**

Electrical

- Power Consumption: <3 W (from backplane)

Mechanical

- Operating Temperature: -20 to +60°C (-4 to +140°F)
- Protection: IP 20

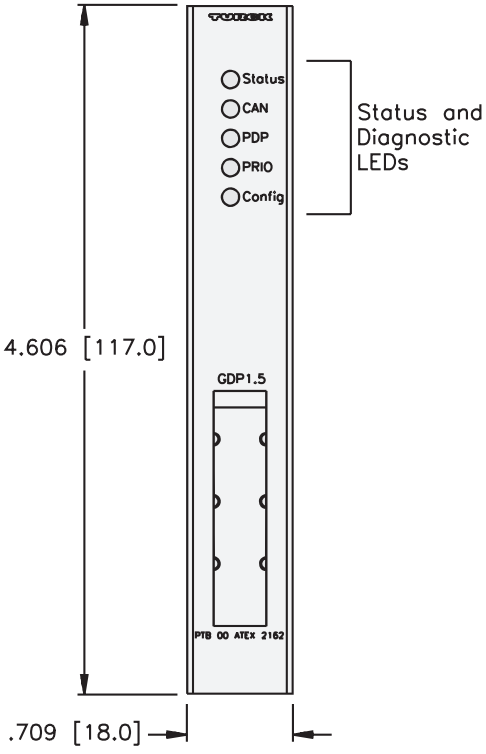
Diagnostics (Logical)

- I/O faults are mapped to the PROFIBUS-DP diagnostic area

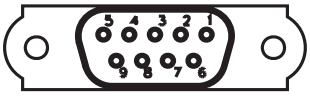
Diagnostics (Physical)

- LEDs to indicate status of PROFIBUS-DP and backplane communication

GDP1.5



PROFIBUS-DP Connector



1 = Shield
3 = BUS_B
5 = DGnd
6 = +5 VDC
8 = BUS_A

Note: Connector is mounted to the excom backplane rack.

4 Channel
Discrete Input Module

- **Modular I/O**
- **PROFIBUS-DP Compatible**
- **Hazardous Area Usage**
- **NAMUR Inputs**

Electrical
- Power Consumption: <2 W (from backplane)
- Sensor Type: NAMUR

Mechanical
- Operating Temperature: -20 to +70°C (-4 to +158°F)
- Protection: IEC IP 20

Diagnostics (Logical)
- I/O faults are mapped to the PROFIBUS-DP diagnostic area
- Open/short-circuit detection is configurable

Diagnostics (Physical)
- LEDs indicate faults for each channel

4 Channel Analog Input Modules

- **Modular I/O**
- **PROFIBUS-DP Compatible**
- **Hazardous Area Usage**
- **HART Capability**

Electrical

- Power Consumption: <3.5 W (from backplane)
- Input Type: 2-wire (AI(H)40EX) or 4-wire (AI(H)41EX) sensors

Mechanical

- Operating Temperature: -20 to +70°C (-4 to +158°F)
- Protection: IEC IP 20

Diagnostics (Logical)

- I/O faults are mapped to the PROFIBUS-DP diagnostic area
- Open/short-circuit detection is configurable

Diagnostics (Physical)

- LEDs indicate faults for each channel

FOUNDATION™ fieldbus General Specifications

FOUNDATION fieldbus is a communication protocol and physical method to interconnect smart devices such as temperature transmitters, pressure transmitters and valve actuators. The physical layer conforms to ISA SP50.02 and IEC 1158-2 standards for fieldbuses.

Fieldbus technology allows many smart devices to share one communication medium. The digital communication signal is superimposed onto a DC carrier. This reduces the amount of terminations to connect all the field devices to a host system and allows greater flexibility for future additions of I/O points.

A FOUNDATION fieldbus device is addressable and can store and transmit data. The devices can store values, track changes and use pre-set alarms to trigger. Based on pre-defined tag names host systems can read transmitter values such as temperature and pressure to set values of a valve actuator.

Digital signal encoding is done using Manchester BiPhase-L and error checking is done with the CRC method. FOUNDATION fieldbus has two types of devices - A Basic Device (BD) which reads inputs, track values and set outputs if programmed to do so - A Link Active Scheduler (LAS) performs the same features as a BD and handles network communication timing between all the active devices on the network.

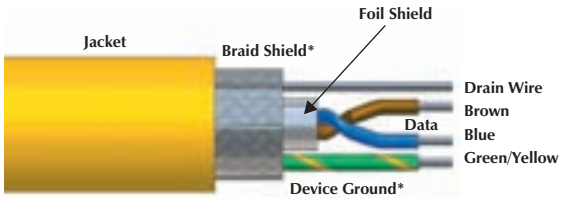
FOUNDATION™ fieldbus, Cable Specifications

- **Cable that Meets the Requirements of ISA/SP50 and FOUNDATION™ fieldbus Requirements for Type A Cable**
- **Cables are Available in 3-wire Versions with a Device Ground or 2-wire Versions**

Figure A



*Available on some cable types

Type A Cable Specifications

- Temperature range: -40 to +105°C
- Governed by: ISA SP50.02 specification
- Sunlight Resistant
- PLTC and ITC Rated (CSA FT4)
- Impedance [Z_0 at f_r (31.25 kHz)] = 100 Ohms ± 20 %
- Maximum Attenuation at 1.25 f_r (39 kHz) = 3.0 dB/km
- Maximum Capacitive Unbalance to Shield = 2 nF/km
- Maximum DC Resistance (per conductor) = 24 Ohms/km
- Maximum Propagation Delay Variance 0.25 f_r to 1.25 f_r = 1.7 µs/km
- Conductor Cross-sectional area (wire size) = nominal 0.8 mm^2 (#18 AWG) or 1.2 mm^2 (#16 AWG)
- Shield Coverage =100 % (90 % minimum)

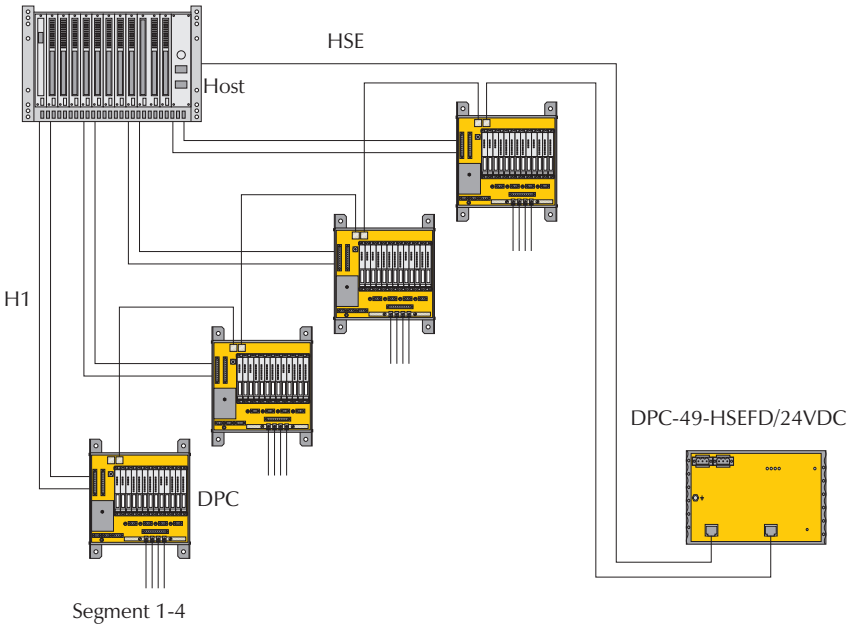
The DPC-System (Diagnostic Power Conditioner System) is a power supply system for the installation of FOUNDATION™ fieldbus H1 segments. It provides comprehensive diagnostic functions for the monitoring of FOUNDATION fieldbus segments and supports asset management for the entire system.

A DPC system consists of one or more module racks (DPC-49-MB-RC) each with up to eight power supply modules (DPC-49-IPS) and one diagnostic module (DPC-49-ADU). Up to four H1 segments for each module rack can be operated and monitored redundantly. The diagnostic data from the H1 segments are transmitted via the HSE interface module (DPC-49-HSEFD/24VDC) to the higher level asset management system.

The diagnostic module (DPC-49-ADU) is used as a communication and diagnostic interface between the H1 segments and the power supply module. The diagnostics module monitors the electrical parameters and the communication parameters of the H1 segments. Operation without diagnostic module is possible. In this configuration, simple diagnostics are provided locally.

The diagnostic information is collected in the device and transmitted via the HSE interface module to the higher fieldbus level (e.g. to the host) as diagnostic and alarm data. The diagnostic module can be plugged in and unplugged during operation (hot swapable).



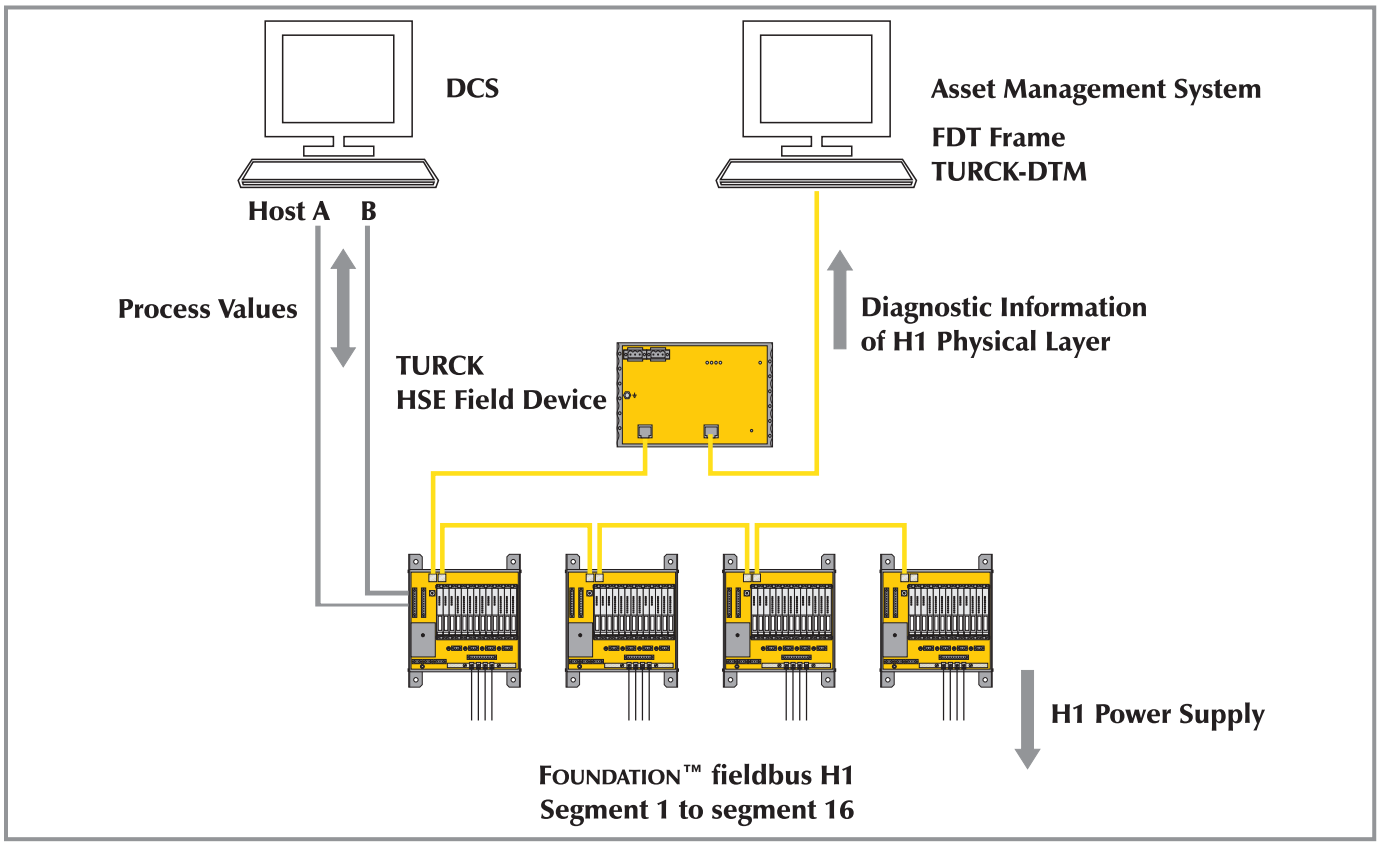
DPC system configuration

Diagnostics via DTM

Fieldbus – The Dynamic Asset

Information concerning the components of the control system and field devices are typically stored and monitored by that system. Information on assets that make up the communication infrastructure (physical layer components) have been simply stored in an asset management system. With the DPC system, the physical layer components are continuously monitored providing virtually instantaneous information regarding the quality and the status of the communication link.
This aspect of the system is the key to achieving the main objective of asset management to minimize maintenance and lower system operating costs.

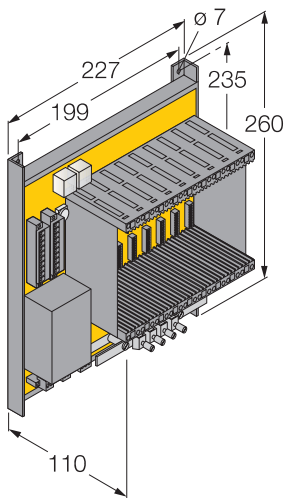
TURCK has drastically improved on existing physical layer components for use in FOUNDATION™ fieldbus applications. The introduction of this system allows the continuous monitoring of every physical layer component, thus treating the entire physical layer as an asset and providing the means for it to be managed as such.



The DPC System detects errors that may develop over an extended period of time or through typical failure modes. These changes can occur due to many factors, such as environmental changes, deterioration of components over time, and any other factors that may affect the physical components of a fieldbus segment. Some of these factors may appear as changes in jitter, hum, noise levels etc. Alarm strategies may be employed that will warn of typical asset errors, potential errors or failures. Preventive measures can be implemented well in advance of a potential system failure. Most common failures can be completely avoided when a preventive maintenance schedule is implemented.
The DPC system also supports the set-up of fieldbus assets by using expedient localization of error sources, as well as documentation indicating a "good condition" of the segment structure.

The DPC system provides an option for redundant segment supplies. The system, fully loaded, can accomodate up to 16 fully redundant FOUNDATION fieldbus segments each with an output of 800 mA and 30 VDC. Diagnostic date is available via a DTM, standard FOUNDATION fieldbus function block libraries or an embedded web server in the HSE field device.

DPC-49-MB-RC — Backplane for the DPC System



The DPC-System (Diagnostic-Power-Conditioner-System) is a power supply system for the installation of FOUNDATION™ fieldbus H1 segments. It offers comprehensive diagnostic functions for the monitoring of FOUNDATION™ fieldbus segments and thus supporting Asset Management for the whole system.

A DPC system consists of one or more module racks DPC-49-MB-RC each with up to eight power supply modules DPC-49-IPS and one diagnostic module DPC-49-ADU. Up to four H1 segments for each module rack can be operated and monitored redundantly in the FOUNDATION™ fieldbus. The diagnostic data from the H1 segments are transmitted via the HSE interface module DPC-49-HSEFD/24VDC to the higher level Asset-Management-System.

The module rack DPC-49-MB-RC consists of a backplane and the actual rack system for the power supply modules and the diagnostic module.

The single components of the system are electrically linked via the connection terminals of the backplane from the user side. Thereby from an electrical perspective, the backplane is to be considered passive.

The power can be supplied via two 2-pole screw connectors. The connection to the host system is established via two system cables. Optional pre-assembled system cables are available at **TURCK**.

For the connection of the H1 segments to the fieldbus side a 2-pole screw connector terminal is provided for each segment, or alternatively a 10-pole screw connector terminal for all segments together on the system side (system connection). Each H1 segment is equipped with a terminating resistor.

Shielding is established via a shielding bus bar DPC-49-SB4 or via the system connection, which is internally connected with the M5 threaded bolt for equipotential bonding.

A connection to the relay alarm contact of the diagnostic module is available for simple diagnostics processing. Additionally a terminal for the connection of test devices is available for each H1 segment.

The rack system is made of extruded aluminum sections. Thus high system stability and shielding is guaranteed. The module rack is suited for wall mounting as well as for 19" rail mounting.

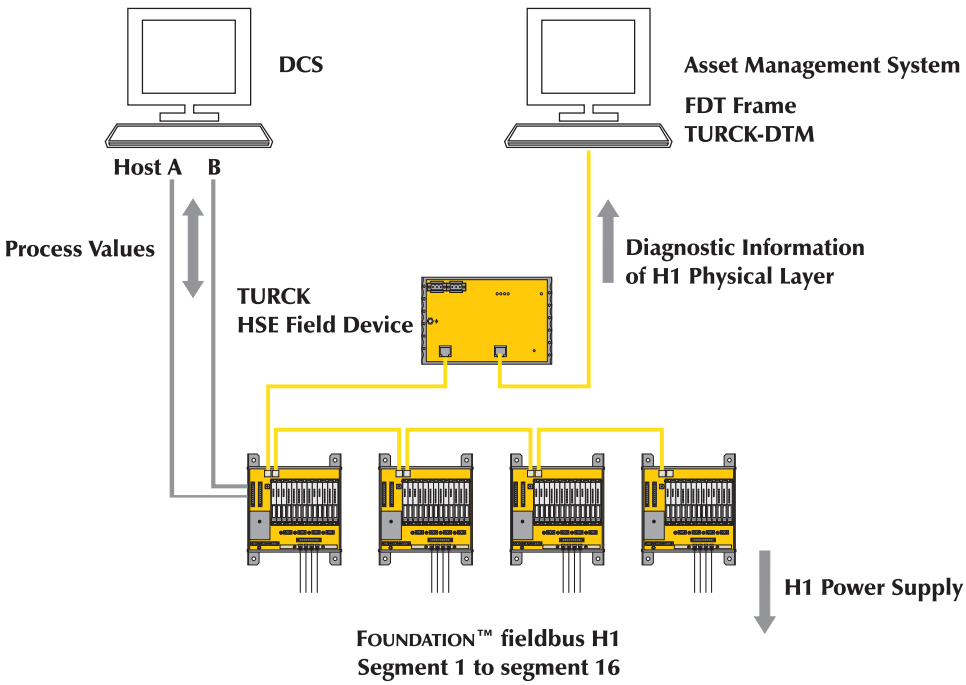
Features:

- Backplane for up to 8 power conditioner modules and 1 diagnostics module
- Exchangeable EMC filter
- Redundant host connection
- Redundant power supply
- Removable terminal blocks with screw connection
- RJ45 connector for HSE fieldbus diagnostics
- Insulated shield terminals
- Terminating resistor with segment output

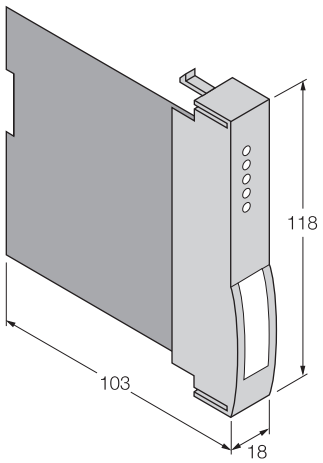
Backplane for the DPC System — DPC-49-MB-RC

Part Number	DPC-49-MB-RC
ID Number	M6882010
Fieldbus Standard	IEC 61158-2
Operating Voltage (Pwr)	18 to 32 VDC
Surge / Overvoltage Suppression	< 250 mA
Connection	Removable terminal block, reverse polarity protected, screw connection RJ45 socket
Protection Degree	IP 20
Ambient Temperature	-20 to +60°C (-4 to +140°F)
Housing Material	Aluminum
Housing Color	Black / Yellow
Dimensions	227 x 260 x 110 mm
Mounting	Flush Panel

Installation Example:



DPC-49-IPS — Power Supply Module



The DPC-System (Diagnostic-Power-Conditioner-System) is a power supply system for the installation of Foundation fieldbus™ H1 segments. It offers comprehensive diagnostic functions for the monitoring of FOUNDATION™ fieldbus segments and thus supporting Asset Management for the whole system.

A DPC system consists of one or more module racks DPC-49-MB-RC each with up to eight power supply modules DPC-49-IPS and one diagnostic module DPC-49-ADU. Up to four H1 segments for each module rack can be operated and monitored redundantly in the FOUNDATION™ fieldbus. The diagnostic data from the H1 segments are transmitted via the HSE interface module DPC-49-HSEFD/24VDC to the higher level Asset-Management-System.

The power supply module provides up to 30 VDC and 800 mA for the installation of the segment. Due to this maximum output power broad segment allocation (up to 1900 m) is possible without restriction.

If two power supply modules are applied, a redundant operation of the segment is possible. Therefore the power supply modules can be plugged in and unplugged shock-free (Hot swapable in run).

Due to complete galvanic isolation:

H1 to H1
H1 for the internal supply
H1 to the diagnostics module
H1 to the HSE diagnostics bus

Potential transfer is avoided and an error-free communication is insured. In order to simplify the start-up and the diagnostics on site, the following LED functions are available:

Pwr: green: Operational readiness
On / Off yellow: Output switched on
Load: yellow: Recognition of consumers (field device) at the segment
Com: yellow: Communication display
Fault: red: Short-circuit message

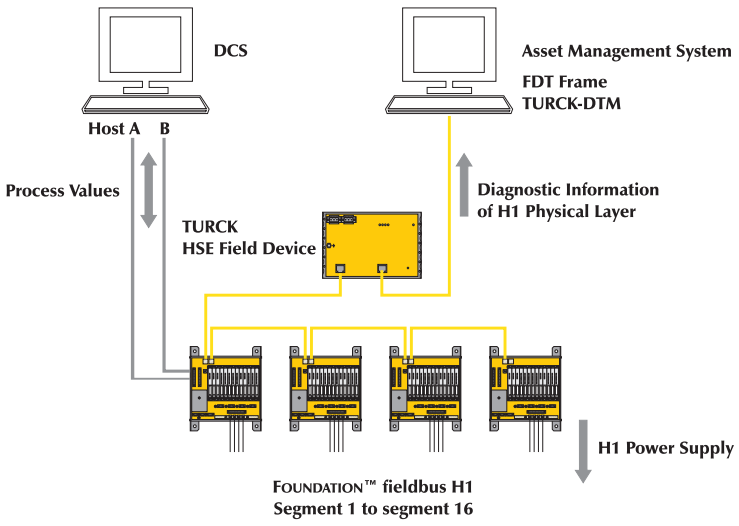
Features:

- Supply of a FOUNDATION™ fieldbus H1 segment
- Output current: 800 mA
- Output voltage: 28 to 30 VDC
- Local diagnostics via LEDs
- Complete galvanic isolation

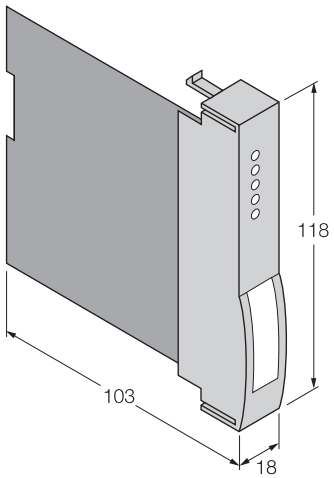
Power Supply Module — DPC-49-IPS

Part Number	DPC-49-IPS
ID Number	M6882013
Fieldbus Standard	IEC 61158-2
Supply Voltage	Via the backplane
Current Consumption	0.8 to 1.7 A
Galvanic Isolation	Complete galvanic isolation, test voltage 500 VAC
Output Circuits	Field
Output Current	≤ 800 mA
Output Voltage	> 28 VDC
Short-circuit Protection	≤ 850 mA
Efficiency	80%
Output Circuits	HOST
Output Current	< 30 mA
Output Voltage	< 27 VDC
Indication	
Operational Readiness	1 x green
Output Active	1 x yellow
Output Current	1 x yellow
Short-circuit Message	1 x red
Bus Communication	1 x yellow
Protection Degree	IP 20
Ambient Temperature	-20 to +60°C (-4 to +140°F)
Housing Material	Plastic / flammability class V-0 to UL 96
Housing Color	Yellow
Dimensions	18 x 118 x 103 mm

Installation Example:



DPC-49-ADU — Diagnostics Module



The DPC-System (Diagnostic-Power-Conditioner-System) is a power supply system for the installation of FOUNDATION fieldbus™ H1 segments. It offers comprehensive diagnostic functions for the monitoring of FOUNDATION fieldbus™ segments and thus supporting Asset Management for the whole system.

A DPC system consists of one or more module racks DPC-49-MB-RC each with up to eight power supply modules DPC-49-IPS and one diagnostic module DPC-49-ADU. Up to four H1 segments for each module rack can be operated and monitored redundantly in the FOUNDATION fieldbus™. The diagnostic data from the H1 segments are transmitted via the HSE interface module DPC-49-HSEFD/24VDC to the higher level Asset-Management-System.

The diagnostic module DPC-49-ADU is used as a communication and diagnostic interface between the H1 segments and the power supply module. The diagnostics module monitors the electrical parameters and the communication parameters of the H1 segments. Operation without diagnostic module is possible.

The diagnostic information is collected in the device and transmitted via the HSE interface module to the higher fieldbus level (e.g. to the host) as diagnostic and alarm data. The diagnostic module can be plugged in and unplugged during operation (Hot swap-able in run).

The device features a LED display which indicates the operating status of the H1 segments. A pre-alarm is indicated yellow and a main alarm red on the LED display. Alarm signals can also be transmitted via a relay contact.

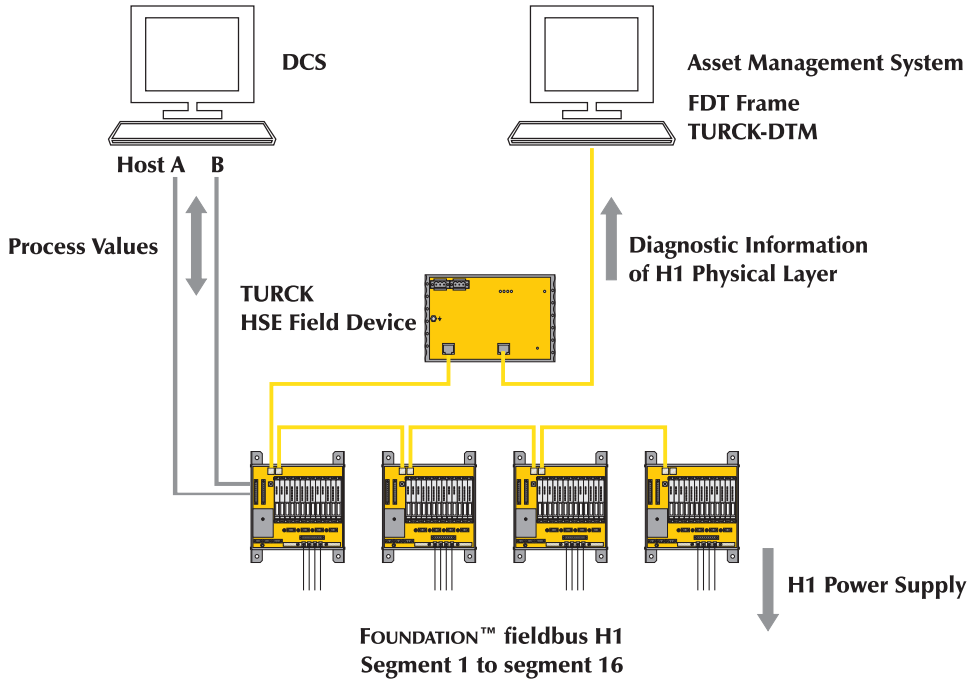
Features:

- Continuous diagnostics for 4 H1 segments
- Local diagnostics via LEDs
- Alarm signal via relay contact
- Complete galvanic isolation

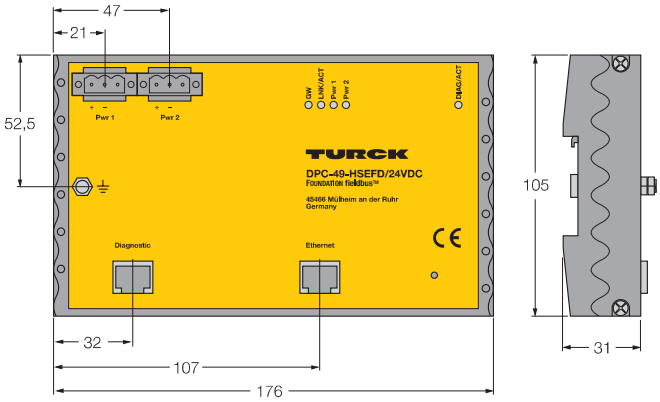
Diagnostics Module — DPC-49-ADU

Part Number	DPC-49-ADU
ID Number	M6882012
Fieldbus Standard	IEC 61158-2
Supply Voltage	Via the backplane
Current Consumption	< 100 mA
Galvanic Isolation	Complete galvanic isolation, test voltage 500 VAC
Diagnosis	1 x relay
Switching Current	≤ 1000 mA
Switching Voltage	≤ 30 VDC galvanically isolated against other electronic parts
Operational Readiness	1 x green / red
Alarm	4 x yellow / red
Protection Degree	IP 20
Ambient Temperature	-20 to +60°C (-4 to +140°F)
Housing Material	Plastic
Housing Color	Yellow
Dimensions	18 x 118 x 103 mm

Installation Example:



DPC-49-HSEFD/24VDC — HSE Field Device



The DPC-System (Diagnostic-Power-Conditioner-System) is a power supply system for the installation of Foundation fieldbus™ H1 segments. It offers comprehensive diagnostic functions for the monitoring of FOUNDATION™ fieldbus segments thus supporting Asset Management for the whole system.

A DPC system consists of one or more module racks DPC-49-MB-RC, each with up to eight power supply modules DPC-49-IPS and one diagnostic module DPC-49-ADU. Up to four H1 segments for each module rack can be operated and monitored redundantly in the FOUNDATION™ fieldbus.

The diagnostic data from the H1 segments are transmitted via the HSE interface module DPC-49-HSEFD/24VDC to the higher level Asset-Management-System. Only the diagnostics data of the diagnostic module DPC-49-ADU are transmitted with the HSE interface module, not the process data of the H1 field device. Each diagnostic module monitors up to four H1 segments.

The HSE interface module is a FOUNDATION™ fieldbus field device, which contains one resource and one transducer block and various standard function blocks. On the basis of these standard function blocks, suitable applications for the analysis of the diagnostics data can be programmed in the control system.

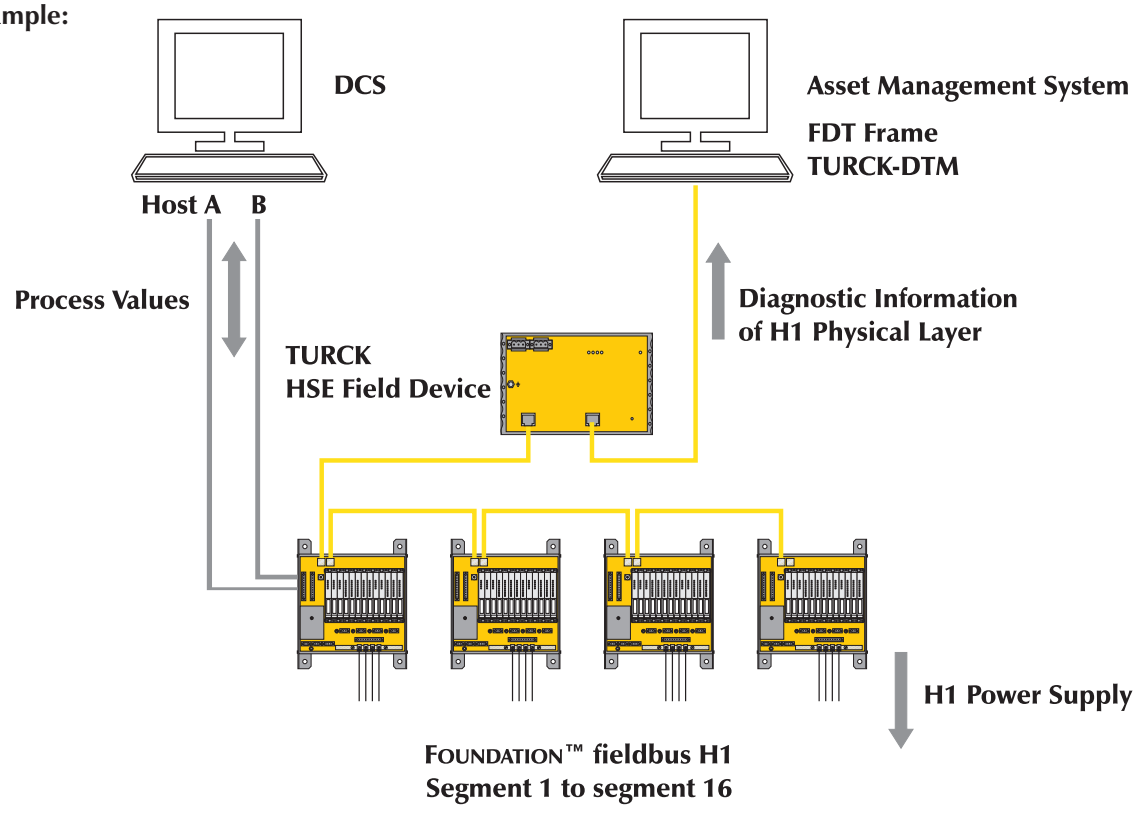
Features:

- HSE interface module for the transmission of diagnostic data
- FOUNDATION™ fieldbus function blocks for remote diagnostics
- Diagnostics via LEDs
- Continuous diagnostics for sixteen H1 segments
- Complete galvanic isolation
- Complete galvanic isolation

HSE Field Device — DPC-49-HSEFD/24VDC

Part Number	DPC-49-HSEFD/24VDC
ID Number	M6882014
Fieldbus Standard	IEC 61158-2
Supply Voltage	Two power terminals - PWR1 & PWR2
Current Consumption	< 100 mA
Galvanic Isolation	Complete galvanic isolation, test voltage 500 VAC
Indication	
Operational Readiness	2 x green
State / Fault	1 x yellow / red
Bus Communication	1 x green / yellow
Int. Communication (CAN)	1 x yellow / red
Protection Degree	IP 20
Ambient Temperature	-20 to +60°C (-4 to +140°F)
Housing Material	Aluminum
Housing Color	Black / Yellow
Dimensions	176 x 105 x 31 mm
Connection Mode	Snap-on DIN rail (DIN 50022)

Installation Example:



FOUNDATION™ fieldbus, Cable and Cordset Selection Matrix

See pages E19 - E20 for dimensional drawings.

* Indicates length in meters.

x Indicates cable type.

Refer to the Cordset Builder at www.turck.com for assistance with cordset/cable combinations.

Standard cable lengths are 0.3, 0.5, 1.0, 2.0, 2.5, 3.0, 3.5, 4.0, 5.0, 6.0, 8.0, 10, 15....50 Meters. Consult factory for other lengths.

For stainless steel coupling nuts change part number RSM ... to RSV, WSM ... to WSV. For ***eurofast armorfast*** ® cable RSC ... to RSA.

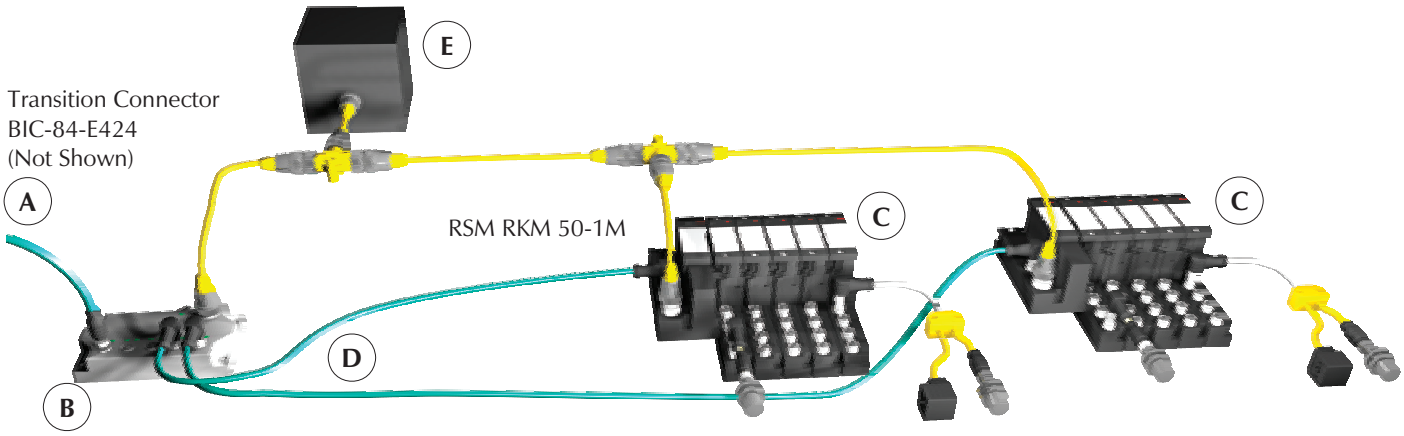
Ethernet System Description

Ethernet is the most popular protocol used to connect office computers and peripherals today. It is increasingly finding its way into other applications, and is rapidly becoming the network of choice for higher level industrial control applications. Ethernet is primarily used to connect PLCs, computers, HMI displays and other high level components.

The term "Ethernet" actually refers to the lower level communication structure. Various different versions, or implementations, of Ethernet are available, such as Ethernet/IP™ and Modbus-TCP. It is important to note that while all of these different specifications use the same physical communication method and can operate on the same cable simultaneously, they cannot necessarily communicate with each other. For example, Modbus-TCP devices cannot communicate with Ethernet/IP devices. This is because the messages and communication protocol have been defined differently for these systems, even though the physical electrical structure is the same. Think of it as two people who speak different languages; they speak by moving air with their mouths, but the rules of the languages are different.

TURCK's BL67 Ethernet gateways provide a convenient way to connect industrial I/O devices directly to the Ethernet system, expediting monitoring and troubleshooting for the overall control scheme.

Typical System Configuration



Basic Parts List

A typical Ethernet system consists of the following parts:

- A - Controller
- B - Switches
- C - Ethernet I/O modules
- D - Ethernet cable
- E - Power supply

Ethernet I/O modules act as clients on a network. A server device is needed to retrieve data from and post data to the client. This is analogous to an office network, where the client PC on a user's desk may actively connect with multiple servers to access information in different areas of the enterprise. **TURCK** Ethernet stations are designed to be fully compatible with established Ethernet standards for industrial use.

Cordsets

TURCK offers a complete line of molded Ethernet cordsets to facilitate network installation, resulting in a faster start-up and fewer wiring errors. Cables are available with stranded or solid-core conductors, with or without shielding.

Most **TURCK** Ethernet equipment uses the 4 or 8-pin (M12) ***eurofast***® connector specifications. These connectors provide a tough, rugged seal, and are IP 67 rated. In some cases (mainly in the control cabinet) a traditional RJ45 Ethernet connector needs to be used. **TURCK** provides RJ45 cordsets, as well as a variety of devices made to convert between RJ45 and ***eurofast*** connectors.

TURCK cordsets for the Ethernet system are available in standard lengths. Please contact your local sales representative to order custom lengths.

Addressing

Industrial Ethernet stations use the IP addressing scheme. An address defined by this scheme consists of four byte values usually displayed in decimal form, for example, 192.168.1.254. Different classifications of networks require different portions of this address to be constant for all devices on the network (referred to as a "subnet"). This means that the number of stations allowed on a particular network varies depending on what class of subnet is being used. If the first three bytes of the IP address are constant (which is common), then the remaining byte may be addressed between 2 and 254, resulting in 253 possible addresses.

Maximum Ratings

Ethernet allows different maximum cable lengths depending on the type of cable being used. Normally an Ethernet segment may be as long as 100 m, where 90 m must be solid core cable and the remaining 10 m can be stranded patch cords.

Ethernet BL67 Stations

TURCK's BL67 is a modular, user configurable network I/O system designed to allow installation of nodes containing different types and sizes of I/O depending on the users needs for a particular area. Featuring IP 67 protection and metal threaded connectors, the BL67 can often be mounted directly on a machine without the need to plan or purchase a separate enclosure for the I/O. This saves planning and installation time, as well as the cost of the enclosure itself.

The BL67 system supports several different network protocols, including Ethernet/IP™ and Modbus-TCP. A BL67 station consists of a gateway module that interfaces to the Ethernet system, and several I/O modules that interface with the physical I/O in the field. Different connector options are available to allow a greater level of customization to the user.

For more details on the BL67 system please see section G of this catalog.

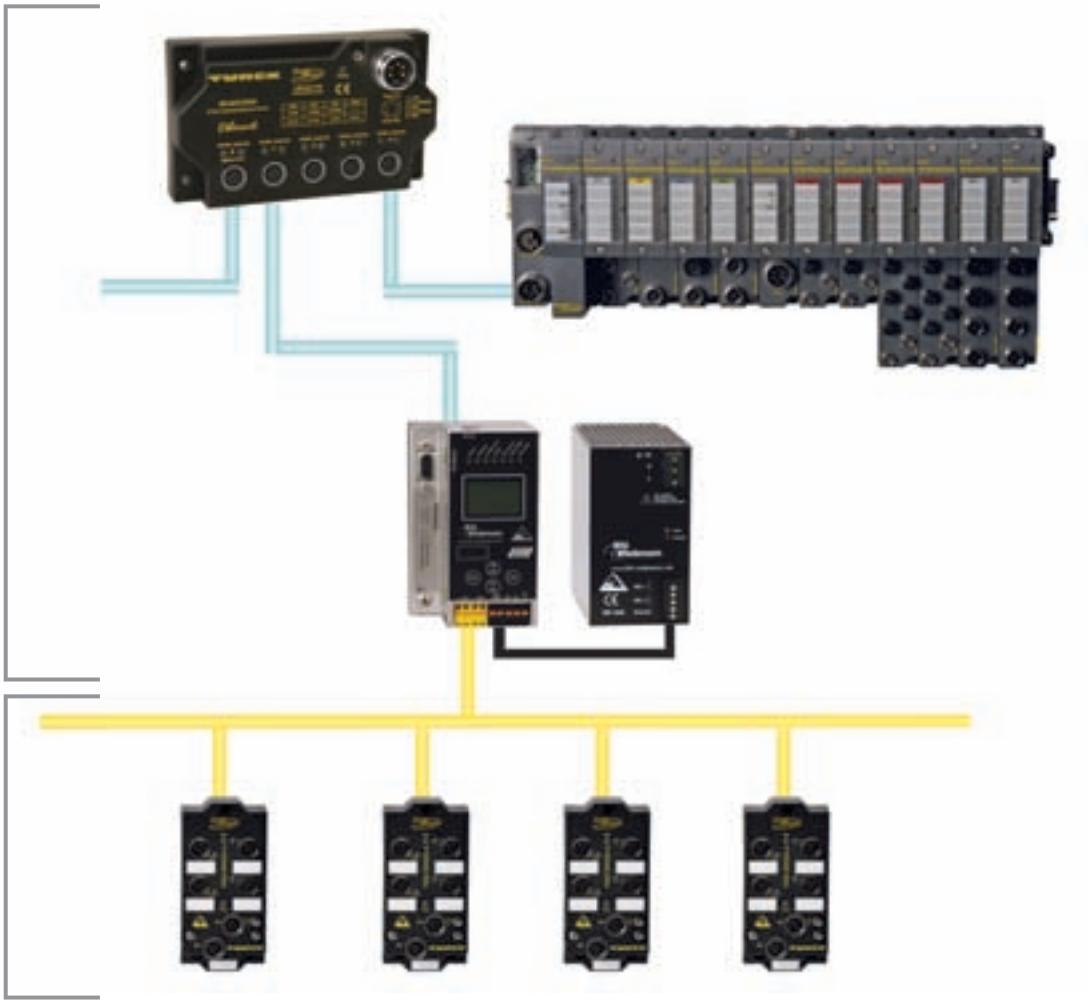
Ethernet to AS-interface® Gateways

AS-I systems can be easily connected to a higher-level network, such as EtherNet/IP™ and Modbus-TCP, through a gateway master. The gateway acts as a master to the AS-I system(s) and a slave to the Ethernet system, mapping all of the AS-I data for Ethernet in a single block.

For AS-I specifications and rating details, see section G of this catalog.

Ethernet System
(Gateway is the Slave)



AS-I System
(Gateway is the Master)

Addressing

Ethernet stations must have an IP address for communication. The address for AS-i/Ethernet gateways may be set via the on-unit display and push buttons. Please consult the manual for a particular gateway for instruction on the procedure.

Diagnostics

AS-i/Ethernet gateways contain LEDs for diagnosing I/O and communication problems for Ethernet and AS-I. For a detailed description of the LED states, see the Bihl+Wiedemann AS-i/Ethernet Gateway User Manual available for download from www.bihl-wiedemann.com.

Power

Most AS-i/Ethernet gateways draw power from the AS-I power supply. The option to use a separate, non-AS-I power supply is also available. Consult the gateway documentation to ensure the gateway being selected meets the requirements of your system.

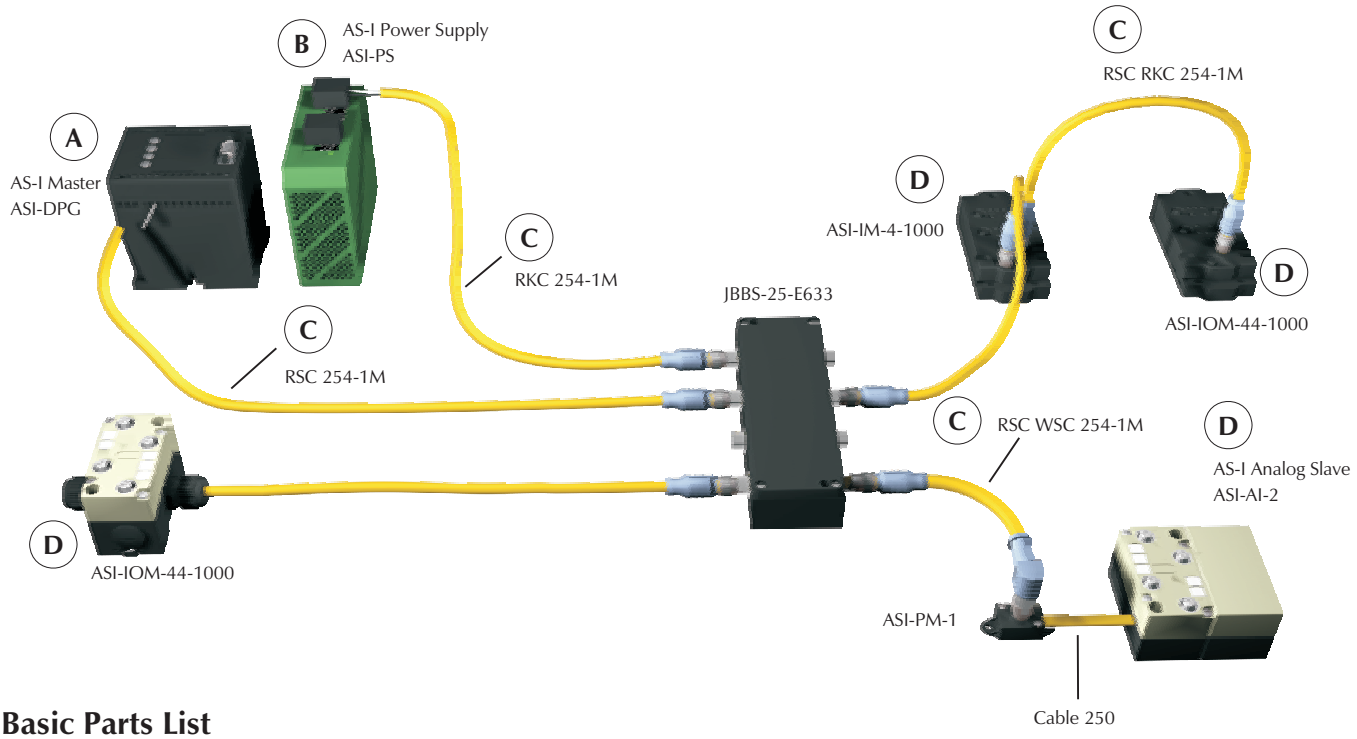
AS-interface® System Description

AS-interface (commonly referred to as AS-I) is a low-level I/O interface system. It was originally intended to be a simple, low cost system that would be easy to install and maintain. With that philosophy in mind, the original developers designed AS-I as a discrete-only two-wire system. It incorporated features like automatic station addressing, and power and data were carried on a single untwisted pair of wires.

As the demand for AS-I grew, so did the demand for more complex devices. The next major version of AS-I, v2.1, extended the protocol to include seamless transfer of analog data, transmission of simple diagnostic data and an extended addressing up to a 62 node scheme that effectively doubled the number of stations allowed on the network. The newest version of AS-I, v3.0, has gone even further, allowing more options for analog data and much more detailed diagnostic information to be communicated. New versions of AS-I are backward compatible and support slaves from earlier versions. Additionally, AS-I was one of the first network systems to incorporate a safety protocol, allowing emergency-stop and machine-stop systems to be seamlessly integrated with the network.

AS-I can be used as a stand alone network or can be connected to a higher level system, such as DeviceNet™ or PROFIBUS®-DP, through a gateway. The gateway acts as a slave to the higher system and a master to the AS-I system.

Typical System Configuration



Basic Parts List

A typical AS-I system consists of the following parts:

A = Master
B = AS-I Power Supply
C = AS-I Cable
D = AS-I I/O Modules (or Slaves)

AS-I stations require a network master (also called a scanner) to interface the stations to the host controller. In some cases the scanner and controller are packaged as a single unit; in other cases the scanner acts as a gateway to a higher level network or to a PLC. **TURCK** AS-I stations are designed to be fully compatible with AS-I equipment from other manufacturers.

TURCK & Bihl+Wiedemann

Bihl+Wiedemann, considered the "AS-I masters", is the leading supplier of AS-I master and gateway products. Their broad product range enables users to select from a wide variety of higher level fieldbuses or PC/PLC control solutions. Additionally, Bihl+Wiedemann provides a wide variety of analog AS-I slaves, PC-board level devices for OEMs and sophisticated AS-I accessory products. **TURCK** has partnered with Bihl+Wiedemann to distribute and support their products in North America.

Cordsets

TURCK offers a complete line of molded AS-I cordsets to facilitate network installation, resulting in a faster start-up and fewer wiring errors. The bus and drop cables are specially designed foil-shielded, high-flex cables with very low inductance and capacitance to minimize propagation delay time. AS-I cables consist of a single untwisted and unshielded wire pair that carries both 30 VDC power and the network data. AS-I was originally designed for use with flat cable using an insulation displacement connection technology, but the use of round cables with sealed connectors has become more common. **TURCK** provides both cable options.

Diagnostics

AS-I has limited field diagnostic capability, due to the limited amount of data transferred in each message. Although with v2.1, a peripheral fault bit can be reported by an AS-I station to indicate a fault with a field device. This allows the user to easily determine the location of a system fault down to the station level. AS-I v3.0 has even more diagnostic capabilities, allowing asynchronous "mailbox" messaging to receive more detailed error information.

Bihl+Wiedemann AS-I masters provide comprehensive information about the status of each station on the network by using register based tables to display each occupied network address.

Addressing

The original AS-I system allowed only 4 bits of data to be transferred in each message for a fast and efficient data transfer system. Slaves could be addressed from one to 31, but with the growth of the network more than 31 stations were often required. Beginning with AS-I v2.1 stations were available with "AB" addressing. This scheme allows the station to be addressed from 1A to 31A or 1B to 31B, with 62 total slaves with four discrete inputs and three discrete outputs each. The extended address range (and the three outputs) is achieved by using one output bit as an AB address.

When both A and B addressed slaves are on the same network, they are scanned on alternating cycles (first all the A slaves are scanned, then all the B slaves). Both AB and single-address slaves can be on the same network. In this case the single-address (non AB style) slaves are scanned every cycle. It's important to note that not all v2.1 slaves use this addressing scheme, although it is often referred to as v2.1 addressing.

Analog Data

Although the original AS-I version only allowed discrete data transfer, v2.1 and higher support seamless analog data transfer. This is accomplished by sending a portion of the analog data on each of several consecutive network cycles; for example, a 16-bit word of data requires seven network cycles. Further, AS-I v3.0 allows analog data to be transferred in a single cycle by consuming more than one address for the analog slave.

Communication Rate/Cycle Time

AS-I communicates at a fixed data rate of 167 kbps. The system's cycle time is very predictable because of the simple communication scheme and fixed data rate. For example, a network with 31 slaves will have a cycle time of less than 5 ms. A network with 62 slaves (all A and B addresses used) will have a cycle time of less than 10 ms. If analog slaves are being used, the cycle time will change to account for the fact that an analog word takes multiple network cycles to transmit.

Maximum Ratings

The AS-I system uses a freeform layout topology. Up to 100 m of cable can be used on a segment before a repeater or tuner needs to be installed to allow the network to be extended beyond the 100 m limit. No terminating resistors are required.

Notes:

AS-interface® Masters and Gateways

TURCK offers a wide variety of AS-I masters and gateways manufactured by Bihl+Wiedemann. These devices control communication on the AS-I network and provide a logical connection from the slave and I/O devices in the field to the host. The terms "master" and "gateway" as used here differ in the following way: A master is an AS-I controller that provides a direct link to the host (PLC, PC, DCS etc.); a gateway is an AS-I master, while also being a slave to a higher-level system (such as DeviceNet™, PROFIBUS®-DP or Ethernet). In the case of a gateway, the AS-I information is compiled by the AS-I master and communicated through the higher-level system as a standard slave data map.

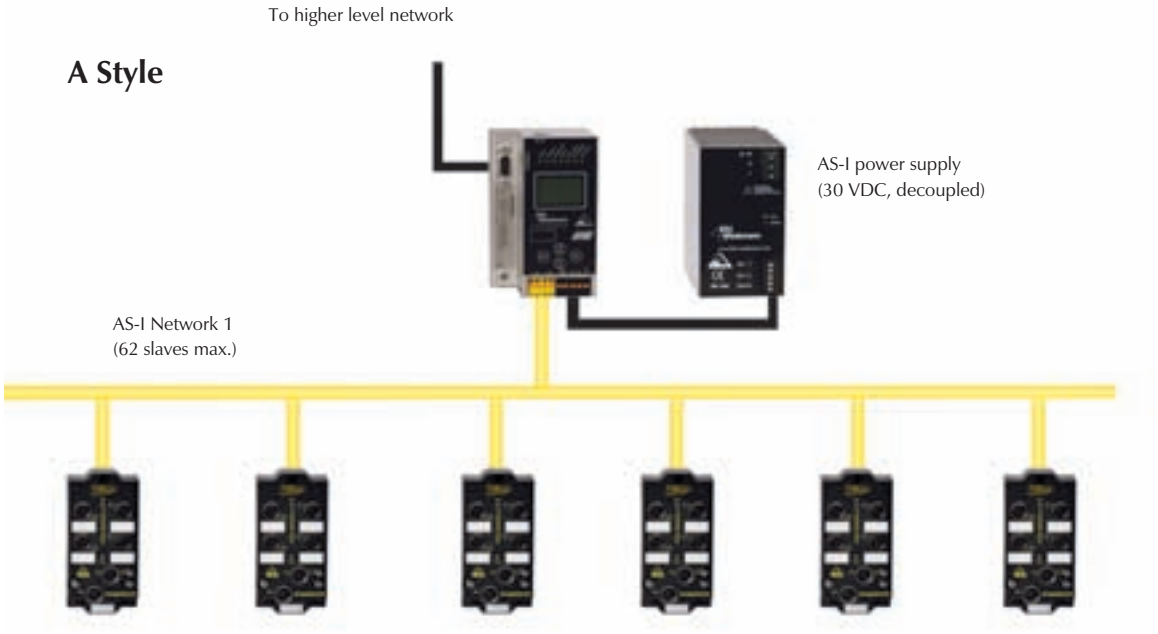
AS-I masters and gateways are available in several different designs. The latest gateway versions incorporate stainless steel housing, support DeviceNet, EtherNet/IP™, Modbus-TCP, PROFIBUS-DP, CANopen and Modbus as higher-level networks, and are available with one or two AS-I masters. These gateways also feature AS-I v3.0 software, and a graphical display for configuration and maintenance with no need for a PC. Other new features include a direct serial connection to the AS-I Control Tools software (requires a connection cable that can be ordered with the software: part number ASI-CT-SS BW1602), ground fault detection and duplicate address detection.

Gateways for some higher-level systems are also available with nylon housing. Some of these feature a graphical display, while others contain a two-digit display for configuration. These gateways may be connected to the AS-I Control Tools software through the higher-level network interface by using a "master simulator".

Masters are available as cards for Allen-Bradley® ControlLogix®, CompactLogix and MicroLogix 1500 PLCs, as well as in several different PC control form factors. Stand-alone masters with RS232, RS485 and RS422 serial connections are also available.

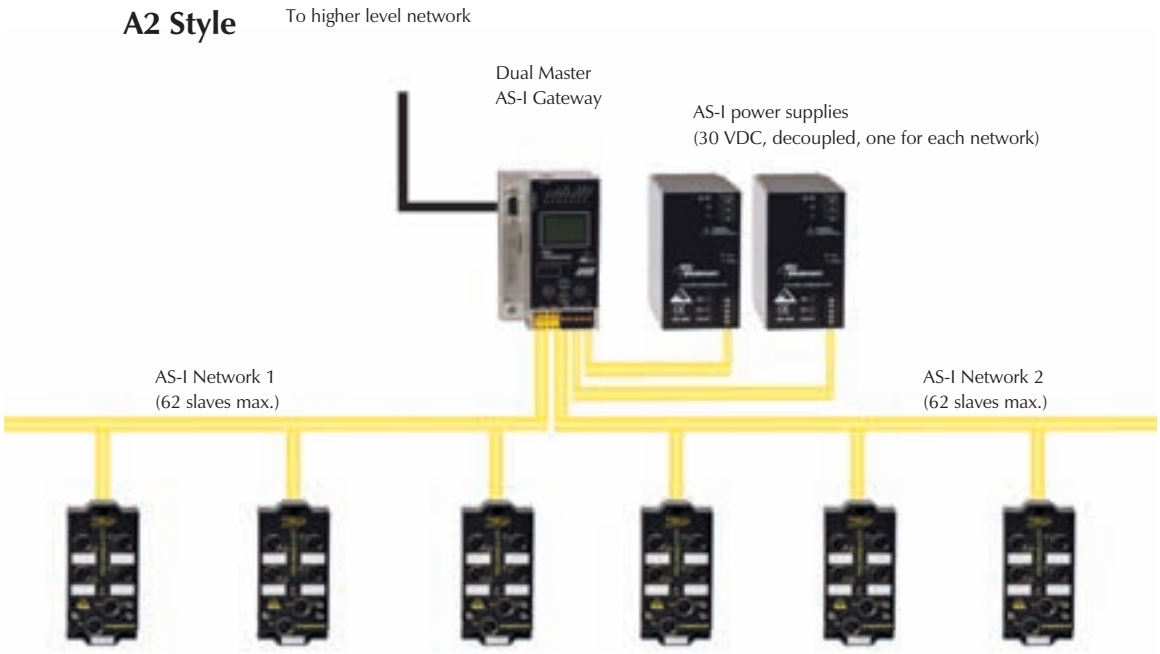
Features

AS-I masters and gateways are available with one or two supported AS-I networks, referred to as “single masters” and “double masters”. Double masters can be used to save cost and cabinet space where the system being installed is too large (physically or due to the number of slaves) for one AS-I network. The master and power supply may be connected anywhere along the network, but should be located next to each other. Slaves and repeaters should not be connected between the master and the power supply, as doing so disables some diagnostic features (such as duplicate address detection and ground fault detection). An example of a system with the “A-style” power supply (gateway is powered from the AS-I power supply) is shown here.



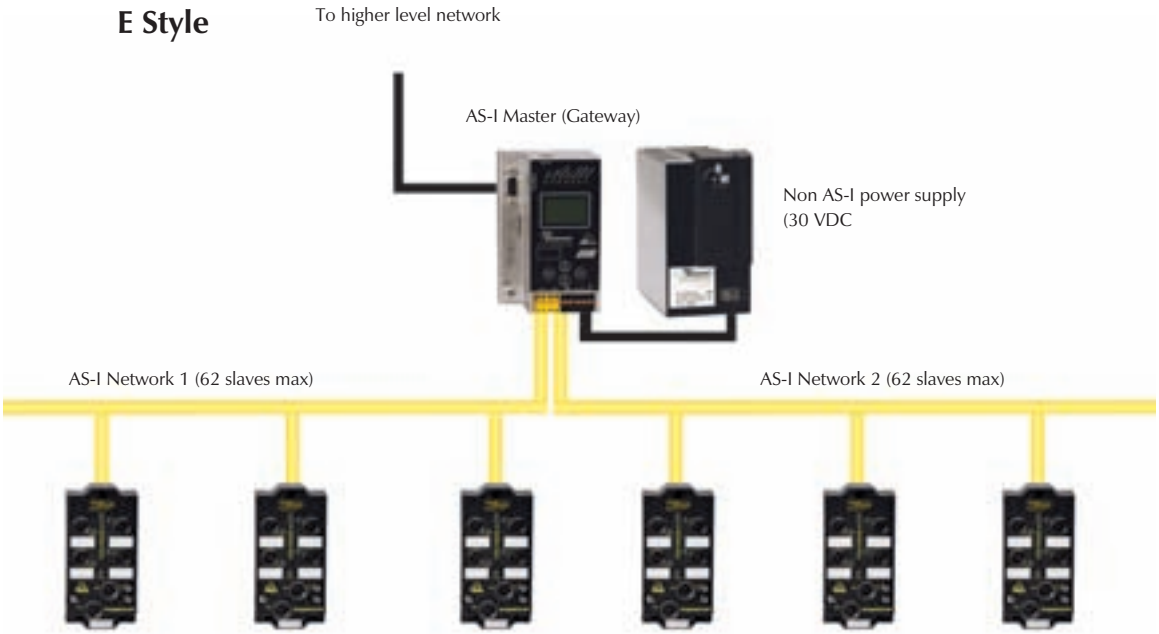
Alternatively, two AS-I networks could be connected to one dual master, as shown. The dual master consists of two AS-I masters and one connection to the higher-level system (or backplane). Note that each AS-I network has its own power supply, but combining the two masters into one unit conserves cabinet space. This is the "A2" power supply configuration (gateway is powered from the AS-I supplies for each network).

A2 Style



A third option is to use a dual master with a single power supply (E-style power configuration). In this case, the master contains the necessary AS-I power supply decoupling circuit for each network. Therefore one 30 VDC power supply can be used for both networks saving even more space and product cost. More than one of these double masters can be supplied from the same 30 VDC source.

E Style



Addressing

Network addresses for all AS-I gateways are programmed via the push buttons on the face of the gateway. For more details, please consult the user manual for the specific gateway in question. Manuals can be downloaded from www.turck.com.

AS-I Masters for AB PLCs

ASI-SCAN-AB-BW1488
ASI-SCAN-AB BW1416
ASI-SCAN-AB/ACT BW1610
ASI-SCAN-AB/ACT BW1611

- **PLC AS-I Masters**
- **Fit Standard Allen-Bradley Backplanes**
- **Analog and Discrete Data Support**
- **Integrated AS-I Diagnostics**

Electrical

- Operating Current: 70 mA from each AS-I supply, 390 mA from 5.1 V backplane supply, 150 mA from 24 V backplane supply (BW1488, BW1611) 100 mA from AS-I supply, 450 mA from 5 V backplane supply (BW1416, BW1610)

Power Distribution

- Power is drawn both from AS-I and the backplane

Mechanical

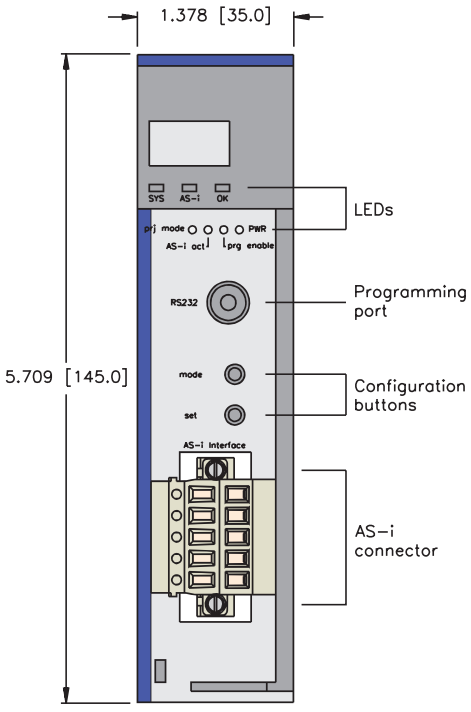
- Operating Temperature: 0 to +55 °C (+32 to +131°F)
- Protection: IP 20

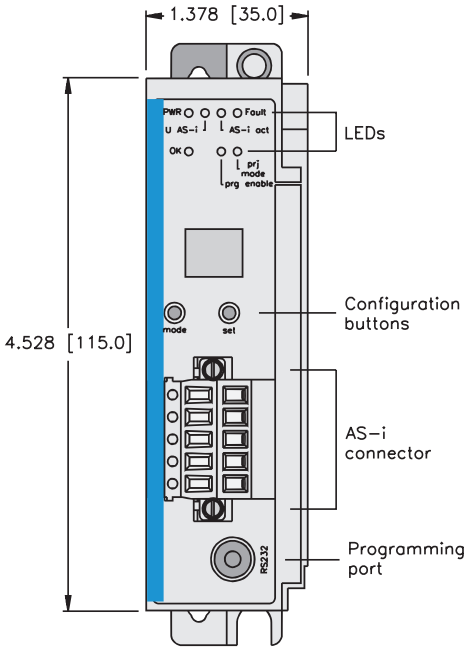
Diagnostics (Logical)

- AS-I I/O faults are reported via the peripheral fault bit for each slave (v2.1 and higher)

Diagnostics (Physical)

- LEDs to indicate status of AS-I and backplane communication and power supply





Note: BW1610 is BW1416 with configuration software. BW1611 is BW1488 with configuration software.

- **AS-I v3.0 Supported**
- **Graphical Display**
- **Integrated Ground-Fault Detection**
- **Integrated AS-I Diagnostics**

Electrical

- Operating Current: 300 mA from VAS-$_{i}$ (Power Supply A)
  200 mA from VAS-$_{i1}$, 70mA from VAS-$_{i2}$ (Power Supply A2)
  250 mA from V_{AUX} (Power Supply E)

Power Distribution

- From AS-I supply for each network (Power Supply A, A2)
- From external supply (Power Supply E)

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20

Material

- Housing: Stainless Steel

Diagnostics (Logical)

- Health of AS-I network is available via Network interface

Diagnostics (Physical)

- LED to indicate status of network and AS-I communication and power supply

Analog Input Stations

ASI-AI-2 BW1345
ASI-AI-2 BW1447
ASI-AI-2A BW1726

- **Analog on AS-I**
- **IP 20 for In-the-Cabinet**
- **Powered by AS-I or Auxiliary Supply**

Electrical

- Operating Current: <80 mA (from AS-I)
- Sensor Current: <40 mA per input

Power Distribution

- Inputs: AS-I or Auxiliary supply, selectable by user
  BW1345, BW1447 default sensor current from AS-I
  BW1726 default sensor current from auxiliary supply

Mechanical

- Operating Temperature: 0 to +70°C (+32 to +158°F)
- Protection: IP 20

Diagnostics (Logical)

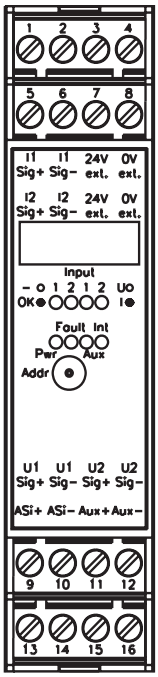
- I/O errors are indicated by the AS-I peripheral fault bit (v2.1 and higher)

Diagnostics (Physical)

- One LED indicates an I/O fault (over or under-range for each channel)
- LEDs to indicate status of AS-I communication and power supply

			Inputs						Data	
Part Number	AS-I Version	Addressing Style	In Count	Style	Group Diagnostics	Individual Diagnostics	OCD	Slave Profile	Map
ASI-AI-2 BW1345	2.1	Single	2	4 to 20 mA/0 to 10 V	X	X	X	7.3-D	1
ASI-AI-2 BW1447	2.1	Single	2	4 to 20 mA/0 to 10 V	X	X	X	7.3-D	1
ASI-AI-2A BW1726	2.1	Single	2	4 to 20 mA/0 to 10 V	X	X	X	7.3-D	1

Input/Output Connectors



I/O Data Map 1

	Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
In	0	Analog Value (LSB)							
	1	Analog Value (MSB)							

* Notes: Data map applies to each channel of analog data used. Resolution is 1 uA/bit in current mode and 1 mV/bit in voltage mode.
BW1345 and BW1726 use range of 4000...20000 for current and 0...10000 for voltage inputs.
BW1447 uses range of 0...27648 (0x0000...0x6C00) for compatibility with existing Siemens based programs.

Analog Input Stations

- **Analog on AS-I**
- **IP 65 Protection**
- **Powered by AS-I or Auxiliary Supply**

ASI-AI-2 BW1232
ASI-AI-2 BW1233

Electrical

- Operating Current: <80 mA from AS-I
- Sensor Current: <40 mA per input

Power Distribution

- Inputs: AS-I or Auxiliary supply, selectable by user

Mechanical

- Operating Temperature: 0 to +70°C (+32 to +158°F)
- Protection: IP 65
- Connections: Cage clamp block through gland fittings

Material

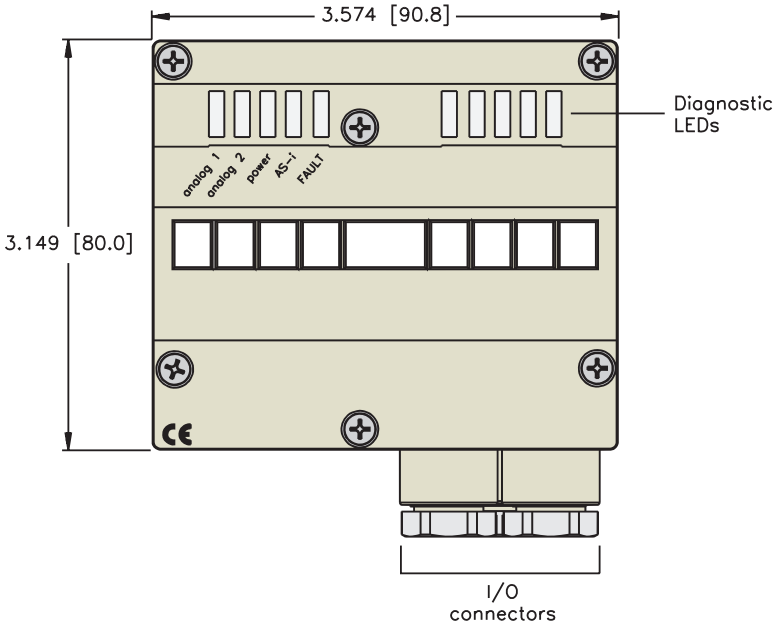
- Housing: Plastic

Diagnostics (Logical)

- I/O errors are indicated by the AS-I peripheral fault bit (v2.1 and higher)

Diagnostics (Physical)

- LEDs indicate I/O faults (over- and under-current or voltage for each channel)
- LEDs to indicate status of AS-I communication and power supply



Part Number	AS-I Version	Addressing Style	Inputs: In Count	Inputs: Style	Inputs: Group Diagnostics	Inputs: Individual Diagnostics	Inputs: OCD	Data: Slave Profile	Data: Map
ASI-AI-2 BW1232	2.1	Single	2	4 to 20 mA	X	X	X	7.3-D	1

In	0	Analog Value (LSB)							
	1	Analog Value (MSB)							

Note: Data map applies to each channel of analog data used. Resolution is 1 uA/bit in current mode and 1 mV/bit in voltage mode. BW1232 range of values is 4000-20000. BW1233 range of values is 0-10000.

AS-I connections are made via standard AS-I base modules (ASI-BM BW1180, ASI-BM BW1182) if I/O is powered by AS-I or auxiliary supply base modules (ASI-BM BW1181, ASI-BM BW1183) if I/O is powered by auxiliary power (see pages E105-106).

Analog Input Stations

ASI-AI-4 BW1364
ASI-AI-4 BW1365
ASI-AI-4PT100 BW1368

- **Analog on AS-I**
- **IP 20 for In-The-Cabinet**
- **Powered by AS-I or Auxiliary Supply**
- **Voltage, Current or Temperature Inputs**

Electrical

- Operating Current: <80 mA from AS-I
- Sensor Current: <40 mA per input (BW1364 and BW1365)

Power Distribution

- Inputs: AS-I or Auxiliary supply

Mechanical

- Operating Temperature: 0 to +70°C (+32 to +158°F)
- Protection: IP 20

Diagnostics (Logical)

- I/O errors are indicated by the AS-I peripheral fault bit (v2.1 and higher)

Diagnostics (Physical)

- LEDs indicate faults for each input
- LEDs to indicate status of AS-I communication and power supply

			Inputs						Data

	1	Analog Value (MSB)							

Note: Data map applies to each channel of analog data used. Resolution is 1 uA/bit in current mode, 1 mV/bit in voltage mode and 0.1 °C in temperature mode (range is -200 to +850°C).

Temperature Input Stations

- **Analog on AS-I**
- **IP 20 for In-The-Cabinet**
- **Powered by AS-I or Auxiliary Supply**
- **Relay Output Option**

ASI-AI-4PT100 BW1254
ASI-AI/DO-2RTD/2R BW1552

Electrical

- Operating Current: <80 mA from AS-I

Power Distribution

- Inputs: AS-I or Auxiliary supply (BW1368 is only powered from AS-I)

Mechanical

- Operating Temperature: 0 to +70°C (+32 to +158°F)
- Protection: IP 65
- Connections: Cage clamp block through gland fittings

Material

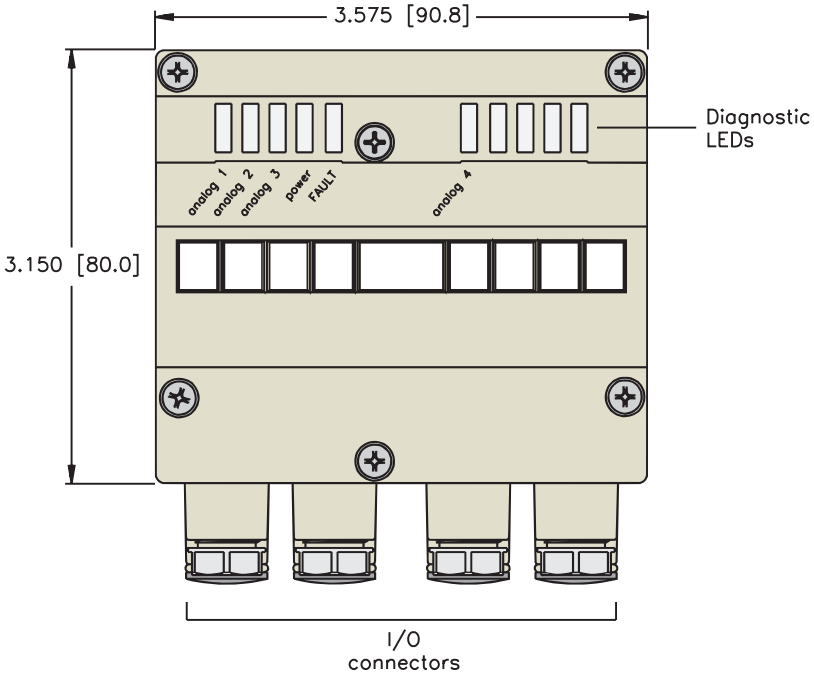
- Housing: Plastic

Diagnostics (Logical)

- I/O errors are indicated by the AS-I peripheral fault bit (v2.1 and higher)

Diagnostics (Physical)

- LEDs indicate faults for each input
- LEDs to indicate status of AS-I communication and power supply



Part Number	Inputs									Outputs				Data

	1	Analog Value (MSB)							

Note: Data map applies to each channel of analog data used. Resolution is 0.1 °C/bit in RTD mode (range is -200 to +850 C).

For BW1552 relay outputs are set via parameter bits 2 and 3.

AS-I connections are made via standard AS-I base modules (ASI-BM BW1180, ASI-BM BW1182) if I/O is powered by AS-I or auxiliary supply base modules (ASI-BM BW1181, ASI-BM BW1183) if I/O is powered by auxiliary power (see pages E105-106).

Analog Output Stations

ASI-AO-2 BW1412
ASI-AO-2A BW1727

- **Analog on AS-I**
- **IP 20 for In-The-Cabinet**
- **Powered by AS-I or Auxiliary Supply**
- **Voltage and Current Outputs**

Electrical

- Operating Current: <80 mA from AS-I

Power Distribution

- Outputs: AS-I or Auxiliary supply, selectable by switch inside housing
  BW1412 default from AS-I
  BW1727 default from auxiliary supply

Mechanical

- Operating Temperature: 0 to +70°C (+32 to +158°F)
- Protection: IP 20

Diagnostics (Logical)

- I/O errors are indicated by the AS-I peripheral fault bit (v2.1 and higher)

Diagnostics (Physical)

- LEDs indicates an I/O fault (over- or under-range for each channel)
- LEDs to indicate status of AS-I communication and power supply

Scale Input Station

- **Analog on AS-I**
- **IP 65 Protection**
- **Power from AS-I**
- **Unique I/O Configurations**

ASI-AI-1SCALE BW1465

CE

Note: This station is designed for connecting a load cell to AS-I.

Electrical

- Operating Current: <80 mA from AS-I

Power Distribution

- Inputs: AS-I power supply

Mechanical

- Operating Temperature: 0 to +70°C (+32 to +158°F)
- Protection: IP 65
- Connections: Cage clamp block through gland fittings

Material

- Housing: Plastic

Diagnostics (Logical)

- I/O errors are indicated by the AS-I peripheral fault bit (v2.1 and higher)

Diagnostics (Physical)

- LEDs indicate I/O faults
- LEDs to indicate status of AS-I communication and power supply

			Inputs						Data

	1	Analog Value (MSB)							

Note: Resolution is 16 bits.
Calibration is done via Windows software and the special BW1260 master.
AS-I connections are made via standard AS-I base modules (ASI-BM BW1180, ASI-BM BW1182) (see pages E105-106).

Analog Input Stations

ASI-AI-02-M12-V3 BW1893
ASI-AI-02-M12 BW1894
ASI-AI-02RTD-M12-V3 BW1895

- **Analog on AS-I**
- **Power from AS-I**
- **IP 65 Protection**
- **Current or PT100 Inputs**

Electrical

- Operating Current: <200 mA (BW1893, BW1894) or <80 mA (BW1895) from AS-I
- Sensor Current: <40 mA per input (BW1893, BW1894)

Power Distribution

- Outputs: AS-I power supply

Mechanical

- Operating Temperature: 0 to +70°C (+32 to +158°F)
- Protection: IP 65

Material

- Housing: Plastic

Diagnostics (Logical)

- I/O errors are indicated by the AS-I peripheral fault bit (v2.1 and higher)

Diagnostics (Physical)

- LEDs indicate an I/O fault (over- or under-range for each channel)
- LEDs to indicate status of AS-I communication and power supply

- **IP 65 Protection**
- **Voltage or Current Outputs**
- **Powered by AS-I or Auxiliary Supply**

ASI-AO-4-M12 BW1361
ASI-AO-4-M12 BW1362
ASI-AO-4-M12 BW1722
ASI-AO-4-M12 BW1736

Electrical

- Operating Current: <200 mA (except BW1722 is <100 mA) from AS-I
- Output Current: 1.1 A per output from auxiliary power (BW1722 only)

Power Distribution

- Outputs: AS-I power supply (except BW1722 is auxiliary power supply)

Mechanical

- Operating Temperature: 0 to +70°C (+32 to +158°F)
  (except BW1736 is -20 to +70°C) (-4 to +158°F)
- Protection: IP 65

Material

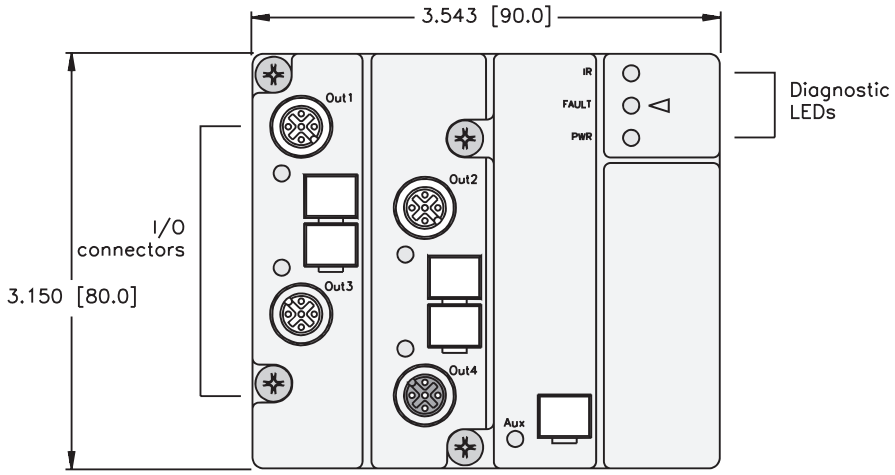
- Housing: Plastic

Diagnostics (Logical)

- I/O errors are indicated by the AS-I peripheral fault bit (v2.1 and higher)

Diagnostics (Physical)

- LEDs indicate an I/O fault for each channel
- LEDs to indicate status of AS-I communication and power supply



Note: ASI-AO-4-M12 BW1722 supplies up to 1.1 A for powering output devices.

			Outputs				Data

Note: Data map applies to each channel of analog data used. Resolution is 1 uA/bit in current mode and 1 mV/bit in voltage mode.

BW1361, BW1722 range of values is 0-20000. BW1362, BW1736 range of values is 0-10000.

AS-I connections are made via standard AS-I base modules (ASI-BM BW1180, ASI-BM BW1182) if I/O is powered by AS-I or auxiliary supply base modules (ASI-BM BW1181, ASI-BM BW1183) if I/O is powered by auxiliary power (see pages E105-106).

AS-I Counter Stations

ASI-AI-2C BW1574
ASI-AI-4C BW1710
ASI-AI-1C BW1723*
ASI-AI-1C BW1711*

* Not UL

- **Count Signals Over AS-I**
- **1 to 4 Channels**
- **IP 65 Protection**
- **Powered by AS-I or Auxiliary Supply**

Electrical

- Operating Current: <200 mA (from U_B)
- Sensor Current: <150 mA from AS-I (except BW1723 is <700 mA from aux. supply)

Power Distribution

- Inputs: AS-I supply (except BW1723 from auxiliary supply)

Mechanical

- Operating Temperature: 0 to +70°C (+32 to +158°F)
- Protection: IP 65

Material

- Housing: Plastic

Diagnostics (Logical)

- Overflow and underflow errors are reported via the AS-I peripheral fault bit (except BW1711)

Diagnostics (Physical)

- LEDs indicate the status of each I/O point
- LEDs to indicate status of AS-I communication and power supply

	1	Count Value (MSB)							

Note: Data map applies to each counter channel.
Range is -32768…+32767.

I/O Data Map 2

	Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
In	0					Count Value			

Note: Range is 0…15.

AS-I connections are made via standard AS-I base modules (ASI-BM BW1180, ASI-BM BW1182) if I/O is powered by AS-I or auxiliary supply base modules (ASI-BM BW1181, ASI-BM BW1183) if I/O is powered by auxiliary power (BW1723 only) (see pages E105-106).

AS-I Code Block

ASI-CODEBLK BW1527

- **Provides a Fixed Value**
- **IP 67 Protection**
- **Use to Code Tools or Machine Components**
- **Powered by AS-I**

Electrical

- Operating Current: <50 mA from AS-I

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 65

Material

- Housing: Plastic

Diagnostics (Logical)

- Faults are reported via the AS-I peripheral fault bit (v2.1 and higher)

Diagnostics (Physical)

- LEDs indicate I/O faults
- LEDs to indicate status of AS-I communication and power supply

			Inputs					Data
Part Number	AS-I Version	Addressing Style	In Count	# Addresses Occupied	Style	Range	Slave Profile	Map
ASI-CODEBLK BW1527	2.1	AB	8 bits	2	Code	0 to 255	0.A-F-E	1

Note: This station occupies two AS-I addresses, each with four inputs. The input values are fixed by two rotary switches to proved a code value

I/O Data Map 1

	Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
In	0	Code (High Nibble)				Code (Low Nibble)			

AS-I connections are made via standard AS-I base modules (ASI-BM BW1180, ASI-BM BW1182) (see pages E105-106).

AS-I Repeaters

REP-ASI BW1855

- **Extend AS-I Network Length**
- **IP 20 for In-The-Cabinet**
- **Isolate AS-I Power Segments**
- **Fault LED Aids in Diagnostics**

Electrical

- Operating Current: <60 mA from each AS-I segment (<120 mA total)

Power Distribution

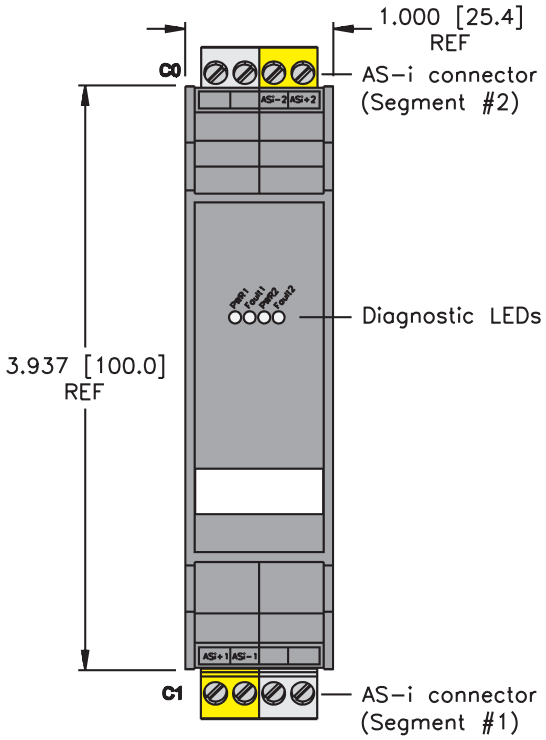
- Each isolated segment is powered from it's respective AS-I power supply

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20

Diagnostics (Physical)

- LEDs to indicate status of AS-I communication and power supply



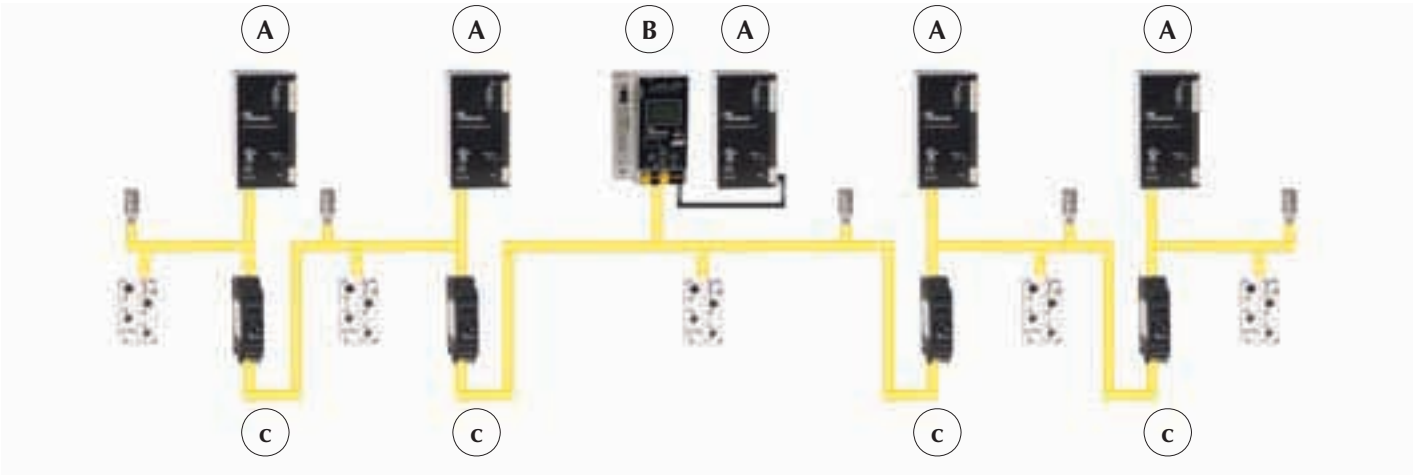
Enclosure Mounted AS-interface Repeater

The **REP-ASI BW1855** is an IP 20, DIN-rail mountable repeater for use an enclosure mounted AS-I extension solution. Network segments attached by a repeater are considered separate physical networks (trunk and drop lengths for each segment are determined as if the other segments are not present), but one logical network (addresses cannot be duplicated; the scanner and configuration tools work as a single network).

The repeater does not consume an address and is invisible to all the other devices on the network. The repeater supports a network extension of one full segment (an additional 100 m of AS-I cable). The REP-ASI BW1855 can be used in conjunction with an AS-I Tuner (ASI-TUNER BW1648 or ASI-TUNER-DIAG BW1843) to extend the network with segment lengths greater than 100 m. Repeaters can also be used to isolate power supplies on networks with multiple supplies, allowing greater than 8 A on the entire AS-I system (no individual segment may carry more than 8 A).

Up to two repeaters are allowed between any slave and the master. Placing the master in the middle of the system allows a maximum linear system of 500 m (if standard repeaters are used) or potentially 1000 m (if terminators and advanced repeaters are used), as shown in the diagram below.

A = Power supply
B = Master
C = Repeaters



AS-I Repeater

- **Extend AS-I Network Length**
- **Isolate AS-I Power Segments**
- **IP65 Protection**
- **Fault LED Aids in Diagnostics**

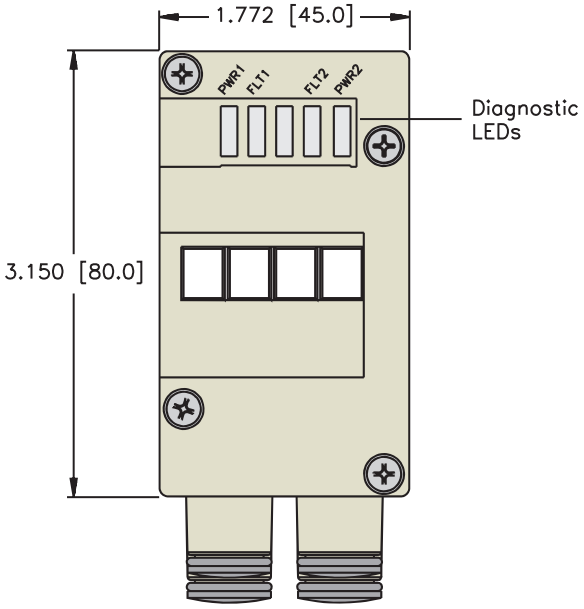
- Connection: Via standard AS-I base module (flat or round cable)

Material
- Housing: Plastic

Diagnostics (Physical)
- LEDs to indicate status of AS-I communication and power supply



Machine Mounted AS-interface ® Repeater

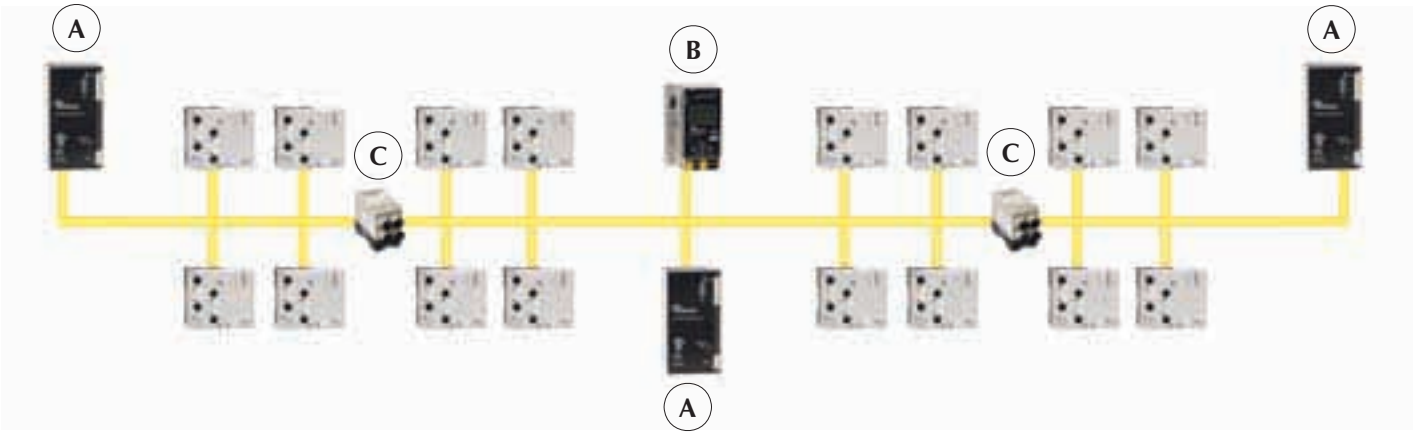
The **REP-ASI BW1273** is an IP 65 repeater for machine mounted AS-I extensions. Network segments attached by a repeater are considered separate physical networks (trunk and drop lengths for each segment are determined as if the other segments are not present), but one logical network (addresses cannot be duplicated; the scanner and configuration tools work as a single network).

The repeater does not consume an address and is invisible to all the other devices on the network. The **REP-ASI BW1273** supports a network extension of one full segment (an additional 100 m of AS-I cable). Repeaters can also be used to isolate power supplies on networks with multiple supplies, allowing greater than 8 A on the entire AS-I system (no individual segment may carry more than 8 A).

Up to two repeaters are allowed between any slave and the master. Placing the master in the middle of the system allows a maximum linear system of 500 m.

The **REP-ASI BW1273** physical wiring connections are made via standard AS-I base modules with two isolated ports (ASI-BM BW1181 for flat cable or ASI-BM BW1183 for round cable with screw terminal connections).

A = Power supplies
B = Master
C = Repeaters



AS-I Tuners

- **Extend AS-I Network Length**

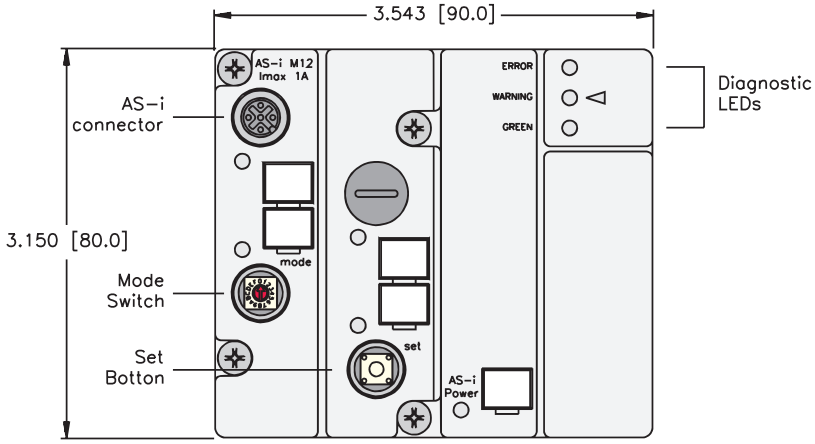
Diagnostics (Logical)

- BW1843 can be configured to be a slave on the AS-I network and report system and station health

Diagnostics (Physical)

- LEDs to indicate status of AS-I communication and power supply

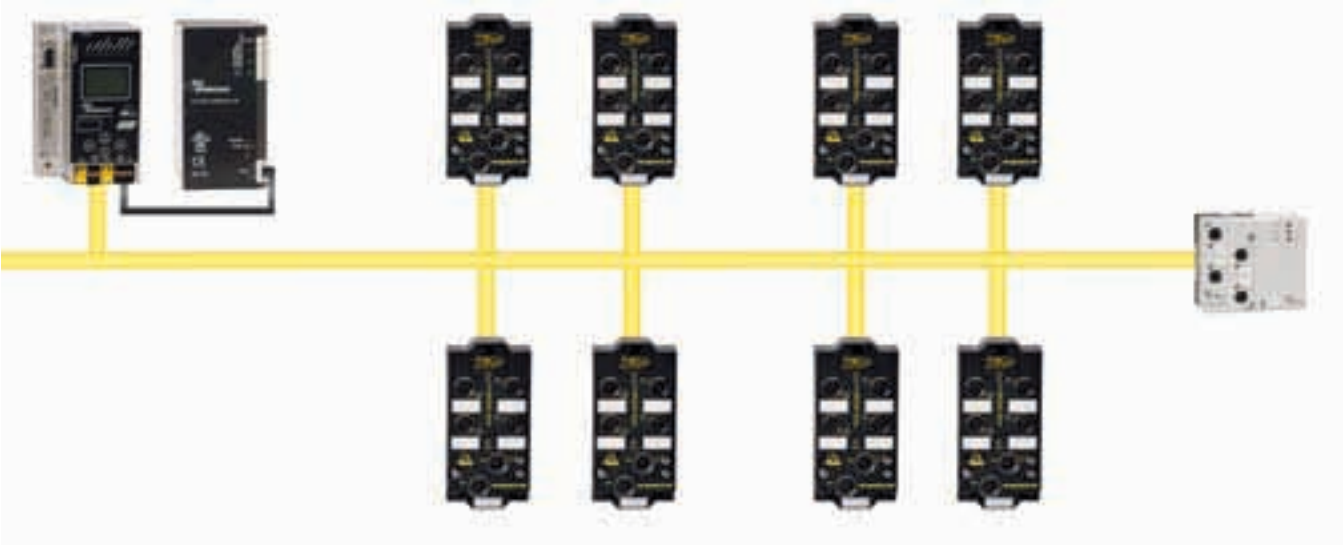


Machine Mounted AS-interface ® Tuners

The **ASI-TUNER BW1648** and **ASI-TUNER-DIAG BW1843** are IP 65 tuners for machine mounted AS-I extension solutions. Tuners are active circuits designed to affect the impedance of an AS-I network so the system can communicate without errors at lengths longer than 100 m. The tuners are configured for the system by placing them in a "teach" mode where they "listen to" AS-I network traffic. In this mode, tuners cycle through LRC impedance values to find the setting where the errors are minimized. Once this value is found, tuners operate in the "run" mode. The tuners also provide a green/yellow/red LED indicating network status, so potential errors can be found early and corrected before they become critical.

The **ASI-TUNER BW1648** does not consume an address and is invisible to all the other devices on the network. The **ASI-TUNER-DIAG BW1843** may be configured as an AS-I slave to allow more detailed diagnostic information to be available as standard I/O data, as well as mailbox information per the AS-I v3.0 specification. The status of all AS-I slaves on the system, as well as the voltage level at the tuner, can be obtained in this mode. Tuners can be used to extend the network length up to 300 m for a single segment (without the need for a repeater). Ideal placement of the tuner on the network is at the furthest point from the power supply.

Tuners connect to the network via standard AS-I base modules (ASI-BM BW1180 for flat cable and ASI-BM BW1182 for round cable with screw terminal connections).



AS-I Masters for OEM Applications

ASI-MM-PCB BW1670
ASI-MM-PCB BW1588
ASI-MMPCB BW1554 (shown)

- **Board-level Masters**
- **Advanced AS-I Diagnostics**
- **8-bit Host Interface**

AS-interface® Couplers

AS-I Couplers provide a means to route data between two PLC's using AS-i. The couplers (similar to a DeviceNet™ spanner) directly connect AS-I networks, eliminating the need for a high level control network pyramid. This simple approach is extremely powerful and economical. It is simple because the coupler appears as a standard AS-I slave to each PLC; any AS-I scanner can send I/O data to the coupler without additional software or complex configuration procedures. It is economical because it replaces the high level control network, eliminating two control cards, wiring, conduit and programming.

Theory of Operation

A coupler transfers data between PLC A and PLC B by appearing as I/O to each PLC. The coupler immediately copies the output data from PLC A to the input data for PLC B. Similarly, PLC B's output data is copied to PLC A's input data. The data transfer may be four bits in each direction (the maximum allowable data size for one slave on one AS-I scan cycle).

Electrically

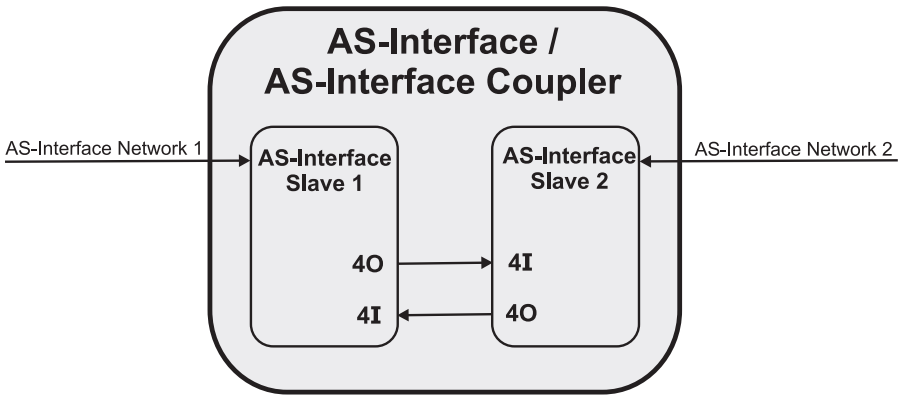
The coupler optically isolates network A from network B; the networks do not interact electrically in any way. The coupler is powered internally by the AS-I power supply for the two connected networks.

Addressing

Because the coupler is essentially two AS-I devices, one on network A and one on network B, it must be addressed as a slave on each network. The addresses for the two networks are independent of each other and do not need to be set to the same value.

Coupler Topology

The coupler is typically used to correct and coordinate multiple work cells.



Note: Physical AS-I connections are made via standard dual isolated port AS-I base modules (ASI-BM BW1181 for flat cable or ASI-BM BW1183 for round cable with screw terminal connections) on pages E105-106.

Network Master Simulators

- **Connect AS-I Gateways to PC for Configuration and Troubleshooting**
- **Test and Troubleshoot Network Devices**

MS-DP BW1131

MS-DP BW1131 is a PROFIBUS®-DP Master Simulator designed to connect PROFIBUS stations to a PC via the serial port. It is ideal for testing, troubleshooting and demonstrating PROFIBUS products. It communicates at rates up to 19.2 kbaud.

MS-DP BW1257

MS-DP BW1257 is a PROFIBUS-DP Master Simulator designed to connect PROFIBUS stations to a PC via the serial port. It features DPV1 communication capability. It is ideal for testing, troubleshooting and demonstrating PROFIBUS products. It communicates at rates up to 19.2 kbaud.

MS-DP BW1258

MS-DP BW1258 is a PROFIBUS-DP Master Simulator designed to connect PROFIBUS stations to a PC via the serial port. It features DPV1 communication capability. It is ideal for testing, troubleshooting and demonstrating PROFIBUS products. This version is powered from a separate 24 VDC supply, and communicates at rates up to 1.5 Mbaud.

IC-232-485 BW1094

IC-232-485 BW1094 is an interface converter that allows RS-485 devices to be connected to a PC RS232 serial port. It is used for connecting the RS-485 AS-I masters to the AS-I Control Tools software for configuration and maintenance.

MS-DN BW1420

MS-DN BW1420 is a DeviceNet™ Master Simulator designed to connect DeviceNet stations to a PC via the USB port. It is ideal for testing, troubleshooting and demonstrating DeviceNet products.

MS-DN BW1625

MS-DN BW1625 is a DeviceNet Master Simulator designed to connect DeviceNet stations to a PC via the PCI backplane. It is ideal for testing and troubleshooting DeviceNet products.

MS-CO BW1453

MS-CO BW1453 is a CANopen Master Simulator designed to connect CANopen stations to a PC via the USB port. It is ideal for testing, troubleshooting and demonstrating CANopen products.

CORD-DSUB BW1097

CORD-DSUB BW1097 is an RS-485 compatible cord that connects IP 65 masters and gateways (i.e. ASI-DPG BW1253) to a PC for commissioning and programming.

CORD-DSUB BW1058

CORD-DSUB BW1058 is a serial 9-in DSUB extension cord that connects masters and gateways to a PC for commissioning and programming.

CORD-DSUB BW1226

CORD-DSUB BW1226 is a CAN compatible cord that connects DeviceNet™ and CANopen gateways to the DeviceNet master simulators (BW1420, BW1625) for commissioning and programming.

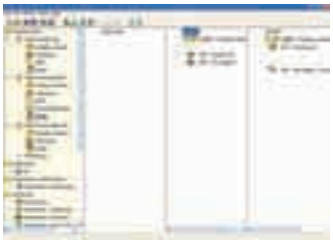
ASI-PD BW1646

ASI-PD BW1646 is a handheld addressing tool for AS-I. It also allows the user to test I/O and slave functionality.

ASI-ANALYZER BW1415

The **ASI-ANALYZER BW1415** is a diagnostic and troubleshooting tool for AS-I systems. The analyzer displays the status of each slave on the network, as well as other details (such as power supply level), and can be used to provide diagnostics for low level AS-I messages. It allows the user to track and observe potential communication failures before they become real problems.

ASI-MON BW1770



ASI-MON BW1770 is a Windows program for use in configuring and diagnosing AS-I Safety at Work systems using the AS-I Safety Monitors. Connection to the safety monitors is made via the PC serial port.

ASI-SIM-SW BW1902

ASI-SIM-SW BE1902 is a MS Windows program that allows simulation and download of AS-I control programs for supported AS-I masters (masters with mini PLC capability). The package includes the ASI-SIM software, ASI-CT BW1203 AS-I Control Tools program and a cable to connect to the stainless steel programming port.

ASI-CT-SS BW1602
ASI-CT-AB BW1563
ASI-CT BW1203

AS-I Control Tools is a MS Windows program for commissioning and programming Bihl+Wiedemann AS-I masters and gateways. The program allows the user to set addresses of slaves, test and manipulate I/O and view diagnostic information.

The **BW1602** package includes a cable to connect gateways in the stainless steel housing to a PC serial port.

The **BW1563** package includes a cable to connect the ASI-SCAN-AB BW1416 and ASI-SCAN-AB BW1488 PLC cards to a PC serial port.

ASI-EVAL-KIT BW1565

The **ASI-EVAL-KIT BW1565** enables easy commissioning of the AS-I OEM master module (ASI-MM-PCB BW1670, p. E79-80). The carrier board has a 5 V controller and an RS232 converter to communicate with the OEM module via the AS-I Control Tools software. The board also has a terminal connector for connection to the AS-I system.

The kit is designed to aid users in developing applications for the OEM AS-I masters.

ASI-TERM BW1644

ASI-TERM BW1644 is an AS-I terminator designed to allow an AS-I segment to be extended up to 200 m. It includes an LED for basic system diagnostic information. It is a passive device, used in a similar manner to the active AS-I tuner (pages E69-70).

AS-I Standard Base Modules

- **Connect IP 65 Stations to AS-I and Power**
- **Round or Flat Cable Supported**

ASI-BM BW1180

Standard AS-I base module with two AS-I flat cable ports.

ASI-BM BW1181

Standard AS-I base module with one AS-I flat cable port and one isolated flat cable port. For use with AS-I devices requiring two separate connections (i.e. repeaters, power extenders, couplers, slaves with auxiliary powered I/O).

ASI-BM BW1438

Standard AS-I base module with two AS-I flat cable ports. Includes addressing port for handheld device.

ASI-BM BW1182

Standard AS-I base module with two AS-I round cable ports. Connections are made via screw terminals.

ASI-BM BW1183

Standard AS-I base module with one AS-I round cable port and one isolated round cable port. For use with AS-I devices requiring two separate connections (i.e. repeaters, power extenders, couplers, slaves with auxiliary powered I/O). Connections are made via screw terminals.

Notes:

AS-interface®, Cable Specifications

- **AS-interface Cable that Meets the Requirements of EN50295e for Communication up to 167 Kbaud**
- **Maximum Cable Length per Segment is 100 Meters**

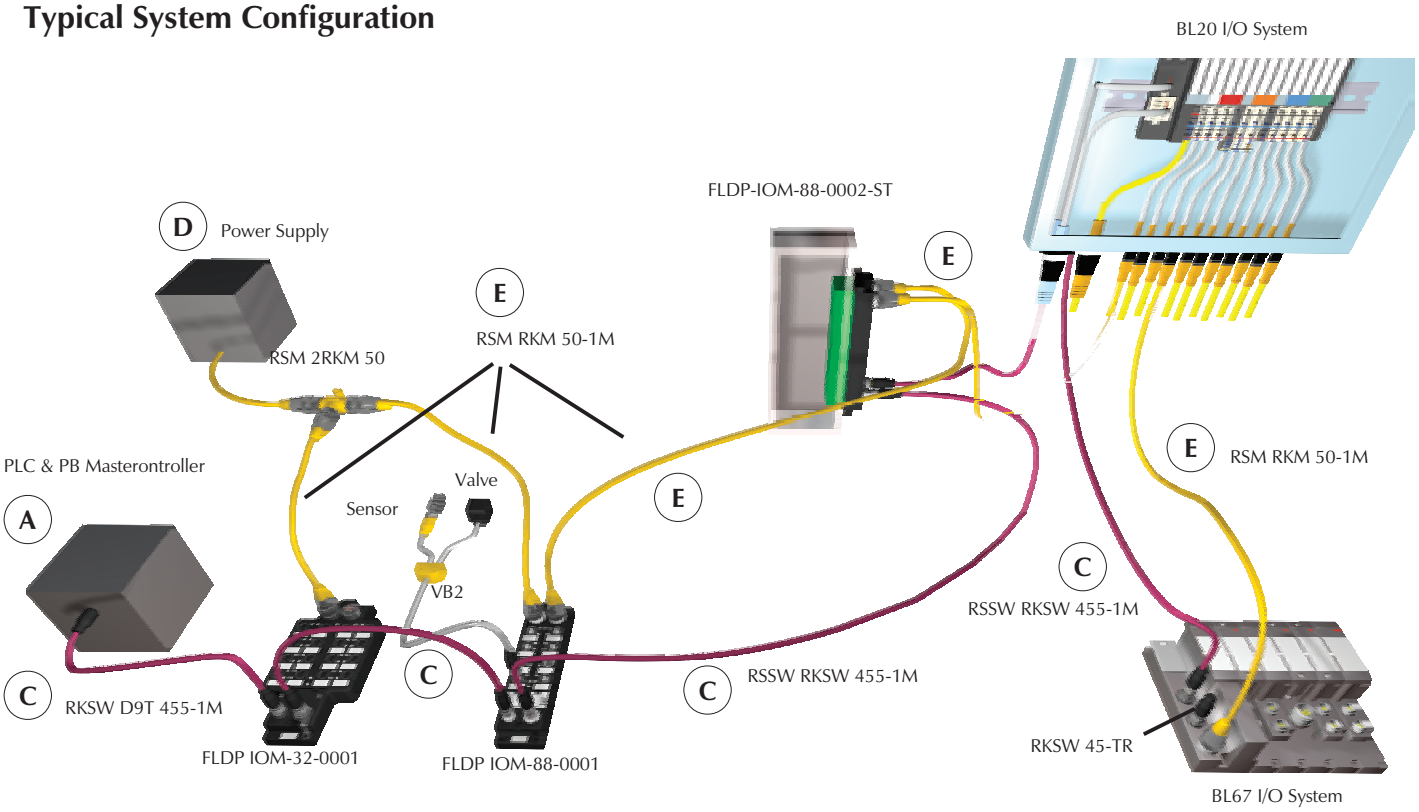
PROFIBUS®-DP System Description

PROFIBUS-DP is an industrial network protocol that connects field I/O devices in order to eliminate hard wiring. The network connection increases device-level diagnostic capabilities, while also providing high-speed communication between devices.

PROFIBUS-DP is based on the RS-485 serial data transfer standard. In most cases, the termination and physical media rules for PROFIBUS-DP are the same as those required for RS-485 communication. A PROFIBUS-DP network supports up to 126 nodes and virtually an unlimited amount of I/O. The bus uses a trunkline/dropline topology. Power and communication are provided via separate cables, allowing easy segmentation of the power structure to avoid overloading.

PROFIBUS-DP is capable of running at data rates as high as 12 Mbaud. When used at high data rates, the cable drop length from the trunk to a node is severely limited. For example, when used at 12 Mbaud, nodes must be directly connected to the trunk, with no drop length allowed.

Typical System Configuration



Basic Parts List

A typical PROFIBUS-DP system consists of the following parts:

- A - Master
- B - Slaves
- C - Communication cable
- D - Power supply
- E - Power cable

PROFIBUS-DP stations require a network master (also called a scanner) to interface the stations to the host controller. **TURCK** PROFIBUS-DP stations are designed to be fully compatible with PROFIBUS-DP equipment from other manufacturers.

Cordsets

TURCK offers a complete line of molded PROFIBUS-DP cordsets to facilitate network installation, resulting in a faster start-up and fewer wiring errors. The bus and drop cables are specially designed foil-shielded, high-flex cables with very low inductance and capacitance to minimize propagation delay time. PROFIBUS-DP cables consist of a shielded and twisted data pair with a bare drain wire.

In most cases, connections of the bus cable to the stations are made using 5-pin reverse-key ***eurofast*** ® (M12) connectors. A variety of stations are also available that support D9 type connections. Power for most stations is provided through one or two 5-pin ***minifast*** ® (7/8-16UN) connectors.

TURCK cordsets for the PROFIBUS-DP system are available in standard lengths. Please contact your local sales representative to order custom lengths.

Diagnostics

TURCK network stations provide increased diagnostics over using traditional hard-wired I/O systems. **TURCK** stations also serve as a buffer between I/O devices and the PROFIBUS-DP network by detecting short circuits without disrupting communication.

The PROFIBUS-DP system includes a provision for special diagnostic data messages. These messages are triggered when a fault occurs at the station (for example a short circuit on a sensor). When the master asks the station for data, the station responds and includes a flag to indicate that diagnostic data is present. The master then asks for the diagnostic data, which is mapped to a special location in the controller's memory.

Addressing

The valid range of PROFIBUS-DP node addresses is 0 to 125. **TURCK** station's addresses are usually set via rotary dials or switches on the node. Changes to the address settings take effect when the station power is cycled or when the station receives a software reset. Care must be taken to prevent the same address from being assigned to more than one node in a system. Bihl+Wiedemann PROFIBUS-DP to AS-I gateways addresses are set in software using the on-unit display.

Communication Rate/Cycle Time

PROFIBUS-DP specifications define multiple transmission speeds ranging from 9.6 kbaud to 12 Mbaud. All nodes on a network must communicate at the same rate.

The complete cycle time of a PROFIBUS-DP system is affected by several factors:

- Number of nodes being scanned
- Amount of data produced and consumed by the nodes
- Network communication rate
- Cycle time of the control program

All of these factors must be considered when calculating the cycle time of a particular network.

GSD Files

GSD files contain detailed information about a PROFIBUS-DP device, including I/O data size and the devices configurable parameters. The information in an GSD file, when used with a PROFIBUS-DP configuration tool, guides a user through the steps necessary to configure a device. GSD files are available on the **TURCK** website (www.turck.com).

Maximum Ratings

The PROFIBUS-DP bus uses a trunkline/dropline topology. The trunk is the main communication cable and requires the appropriate RS-485 termination at both ends of the trunk. Terminating resistors are available as plug-in ***eurofast***® modules or can be built into the D9 connectors. The length of the trunk depends on the communication rate. Drops or branches off the trunk are allowed, but are greatly limited as the communication rate increases. The table shows the maximum ratings for a trunk at different communication rates.

Communication Rate	Max. Segment Length
9.6 kbps	1200 m
19.2 kbps	1200 m
93.75 kbps	1200 m
187.5 kbps	1000 m
500 kbps	400 m
1.5 Mbps	200 m
12 Mbps	100 m

Notes:

PROFIBUS-DP AIM™ Stations

TURCK's Advanced I/O Module (AIM) PROFIBUS stations are extremely rugged stations designed for machine mounting. These stations allow easy connection of standard I/O devices such as sensors, limit switches, valves and pilot lights to a PROFIBUS network, typically without a protective enclosure. This is made possible by epoxy-filled station housings, all-metal connectors and visible rotary address switches, among other things.

Mechanical Specifications

TURCK PROFIBUS AIM stations are designed for machine mounting with no separate enclosure or housing necessary. Quick-disconnect capability, combined with an epoxy-filled housing, creates an extremely durable station that can be mounted in most industrial environments. Detailed environmental specifications are as follows:

- Housing material: Nylon 6
- Connector material: Nickel-plated brass
- Protection level: NEMA 1,3,4,12,13; IEC IP 67
- Operating temperature: FLDP style 0° to +55°C (-40° to +158°F)
- FXDP style -25° to +55°C (-40° to +158°F)
- Vibration: 50 g @ 10 to 500 Hz

Other housing and connector materials available upon request.

The station's components are identified in the following figure.

Connectors

PROFIBUS® AIM™ stations provide connections for the bus, I/O and auxiliary power.

Bus Connectors

eurofast® (M12) (reverse keyed) is the standard bus connector for PROFIBUS AIM stations.

PROFIBUS *eurofast* Pinouts

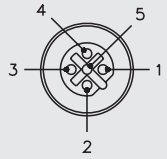
1 = 5 VDC*
2 = BUS _A
3 = Gnd
4 = BUS_B
5 = Shield
* Female connector only

Male	Female
	5-Pin	5-Pin

Different I/O connector pinouts are used for different station types. Stations are available with one or two inputs per connector, one or two outputs per connector, or one input and one output per connector. The pin assignments for these styles are:

***eurofast* Pinouts**

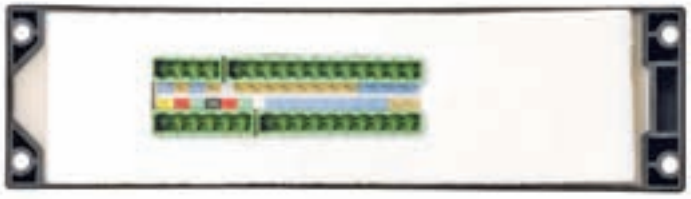
1 - V+ (24 VDC)
2 - Signal B (Odd numbered input)
3 - V- (0 VDC)
4 - Signal A (Even numbered input)
5 - N/C

Female


5-Pin

Screw Terminal I/O Connection

AIM stations with part numbers ending in "ST" support screw terminal I/O and bus connections. The screw terminals for these stations are located on the back of the station. The back of the station is also fitted with a foam gasket to allow the station to be mounted to the outside of a cabinet or field I/O box (i.e. motor control center).



Auxiliary Power Connectors

PROFIBUS® AIM™ stations accept one or two 24 VDC power supplies via the ***minifast***® (7/8-16UN) connectors located at the top of the station. Stations with only inputs require the U_B supply to power station electronics and I/O. Stations with both inputs and outputs need both supplies (U_B and U_L) to be connected. In this case, UB powers the station electronics and the inputs, while U_L powers the outputs. For further details, see the individual station entries in this catalog.

***minifast* Power Pinouts**

1 = Gnd
2 = Gnd
3 = PE
4 = U_B
5 = U_L

Male	Female
	5-Pin	5-Pin

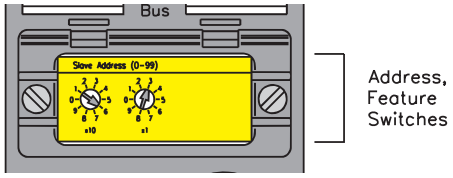
Power

Common power ratings for AIM stations include:

- Voltage: 18-30 VDC (both U_B and U_L)
- Input Voltage: 18-30 VDC (From U_B)
- Input Signal Current (each input): OFF < 2 mA; ON 4 mA (@ nominal 24 VDC)
- Input Delay: 2.5 ms

Addressing

PROFIBUS AIM stations must have a network address for communication. The address for AIM stations may be set via the visible rotary switches under the clear plastic cover on the front of the station.



The pair of switches represents the address as a decimal number; the left switch being the 10's multiplier and the right switch the 1's multiplier. To program the station, rotate the switches with a small slotted screwdriver until the arrows on the switch point to the appropriate numbers for the chosen address. Some stations (with outputs) have a third switch. This switch is used to enable auxiliary power diagnostics. If the switch is on, the loss of output power (U_L) will trigger a PROFIBUS diagnostic message.

Diagnostics

AIM™ stations provide two LEDs for diagnosing communication and power problems.

Bus

- Green: Working properly
- Red: No communication

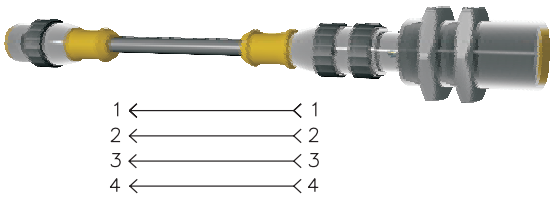
Power

- Off: No power
- Green: Power present
- Red: U_B present, but U_L missing (stations with outputs only)

There is an additional LED for each I/O point on the station. This LED indicates:

- Off: Point is off
- Green: Point is on
- Red: Point is in short-circuit state (advanced diagnostic stations only)

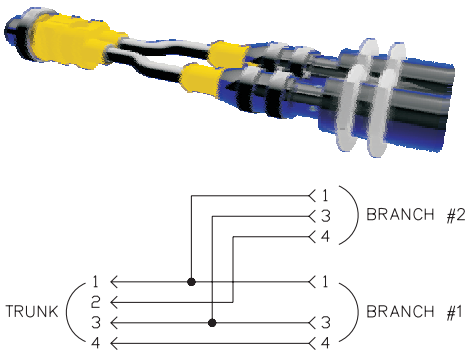
Abbreviations Used in Diagnostic Data Maps	
V_I	Missing input supply voltage
V_O	Missing output supply voltage
SC	Short circuit at the station (or at the particular I/O point if specified)



Connecting Devices to an AIM Station

AIM stations typically provide a ***eurofast***® (M12) connection for each I/O point. Standard **TURCK** I/O cordsets can be used to connect physical devices in the field to the AIM station. Some AIM stations, specifically those with I/O counts greater than eight total points, connect two signals to each connector. If the signals being connected are on the same physical device (for example a sensor with two outputs), a simple four or five-wire cordset can be used for connection.

If the signals are on two separate devices, a splitter can be used to separate the AIM I/O connector into two individual ***eurofast*** connectors. The recommended splitter is wired such that the second signal pin on the AIM station (pin 2) is wired to the default signal pin (pin 4) on the second splitter arm - requiring no special wiring by the user. The splitter is simply plugged into the AIM I/O connector and each arm is plugged into the appropriate I/O devices, as shown:



Standard Input Stations

FLDP-IM 8-0001
FLDP-IM 16-0001

- **Rugged, Fully Potted Stations**
- **IP 67 Protection**
- **Rotary Address Switches**
- **Automatic Baud Rate Sensing**

Electrical
- Operating Current: <110 mA plus sum of input currents (from U_B)
- Sensor Current: <500 mA per four inputs (from U_B)

Power Distribution
- Inputs: U_B power supply

Mechanical
- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: NEMA 1,3,4,12,13 / IEC IP 67
- Vibration: 50 g @ 10-500 Hz

Material
- Connectors: Nickel-plated brass
- Housing: Nylon 6

Diagnostics (Logical)
- Input short-circuit and power supply status mapped to PROFIBUS diagnostic table, one bit indicating each fault for the entire station

Diagnostics (Physical)
- One (...IM 8-0001) or two (...IM 16-0001) LEDs indicates short-circuit for I/O groups
- LEDs to indicate status of PROFIBUS communication and power supply

Electrical

- Operating Current: <110 mA plus sum of input currents (from U_B)
- Sensor Current: <500 mA per eight inputs (from U_B)

Power Distribution

- Inputs: U_B power supply

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: NEMA 1,3,4,12,13 / IEC IP 67
- Vibration: 50 g @ 10-500 Hz

Material

- Connectors: Nickel-plated brass
- Housing: Nylon 6

Diagnostics (Logical)

- Input short-circuit and power supply status mapped to PROFIBUS diagnostic table, one bit indicating each fault for the entire station

Diagnostics (Physical)

- Four LED short-circuits for I/O (groups of eight inputs)
- LEDs to indicate status of PROFIBUS communication and power supply

Standard Input/Output Stations

FLDP-IOM124-0001
FLDP-IOM124-0002

- **Rugged, Fully Potted Stations**
- **IP 67 Protection**
- **Rotary Address Switches**
- **Automatic Baud Rate Sensing**

Electrical

- Operating Current: <150 mA plus sum of input currents (from U_B)
- Sensor Current: <500 mA per group inputs (from U_B group is all inputs for IOM 84 and IOM 88-0002, two groups of four inputs for IOM 88-0001))
- Output Current: See table on facing page (from U_L)

Power Distribution

- Inputs: U_B power supply
- Outputs: U_L power supply

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: NEMA 1,3,4,12,13 / IEC IP 67
- Vibration: 50 g @ 10-500 Hz

Material

- Connectors: Nickel-plated brass
- Housing: Nylon 6

Diagnostics (Logical)

- Input short-circuit and power supply status mapped to PROFIBUS diagnostic table, one bit indicating each fault for the entire station

Diagnostics (Physical)

- One LED indicates short-circuit for all inputs
- LEDs to indicate status of PROFIBUS communication and power supply

PROFIBUS-DP FDP20 Stations

TURCK's FDP20 PROFIBUS stations are low-cost screw-terminal connection stations designed for mounting in an enclosure. These stations provide easy connection of standard I/O devices such as push buttons, pilot lights, motor starters and drives to a PROFIBUS network. FDP20 stations are designed to easily upgrade existing equipment to a PROFIBUS network.

Mechanical Specifications

TURCK FDP20 stations are designed to be mounted in standard equipment enclosures (operator stations, motor control centers, etc.). These stations use screw terminal connections for all I/O and network wiring. Detailed environmental specifications include:

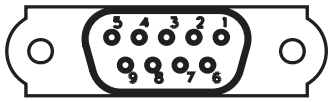
- Housing material: Nylon 6
- Protection level: IP 20
- Operating temperature: 0 to +55°C (32 to +131°F)

The station's components are identified in the figure below.

Connectors

Bus connectors

PROFIBUS-DP D9 Connector

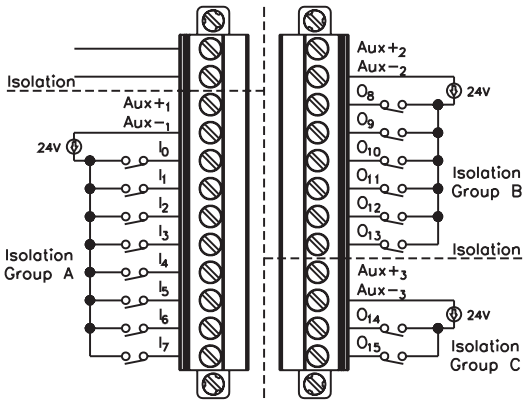


I/O connectors

Each FDP20 version uses a different screw terminal connector. Detailed pinout information is given in the product information on the following pages.

Power

FDP20 stations provide an auxiliary power connection for I/O devices and station electronics. Power can be applied separately to different I/O groups as shown in the following diagram.

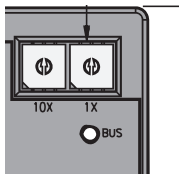


Power ratings for FDP20 stations:

- Operating Voltage: 18-30 VDC (24 VDC nominal)
- Internal Current Consumption: <75 mA (@ nominal 24 VDC) plus sum of I/O currents
- Input Signal Current (each input): OFF < 0.5 mA; ON 1-3.4 mA
- Input Delay: 2.5 ms
- Output Current: 1.8 A max per output (XSG version only)

Addressing

PROFIBUS® stations must have a network address for communication. The address for FDP20 stations may be set via the visible rotary switches on the front of the station.



The pair of switches represents the address as a decimal number; the left switch being the 10's multiplier and the right switch the 1's multiplier. To program the stations, rotate the switches with a small slotted screwdriver until the arrows are pointing at the appropriate numbers for the chosen address.

Diagnostics

FDP20 stations provide LEDs for diagnosing communication problems.

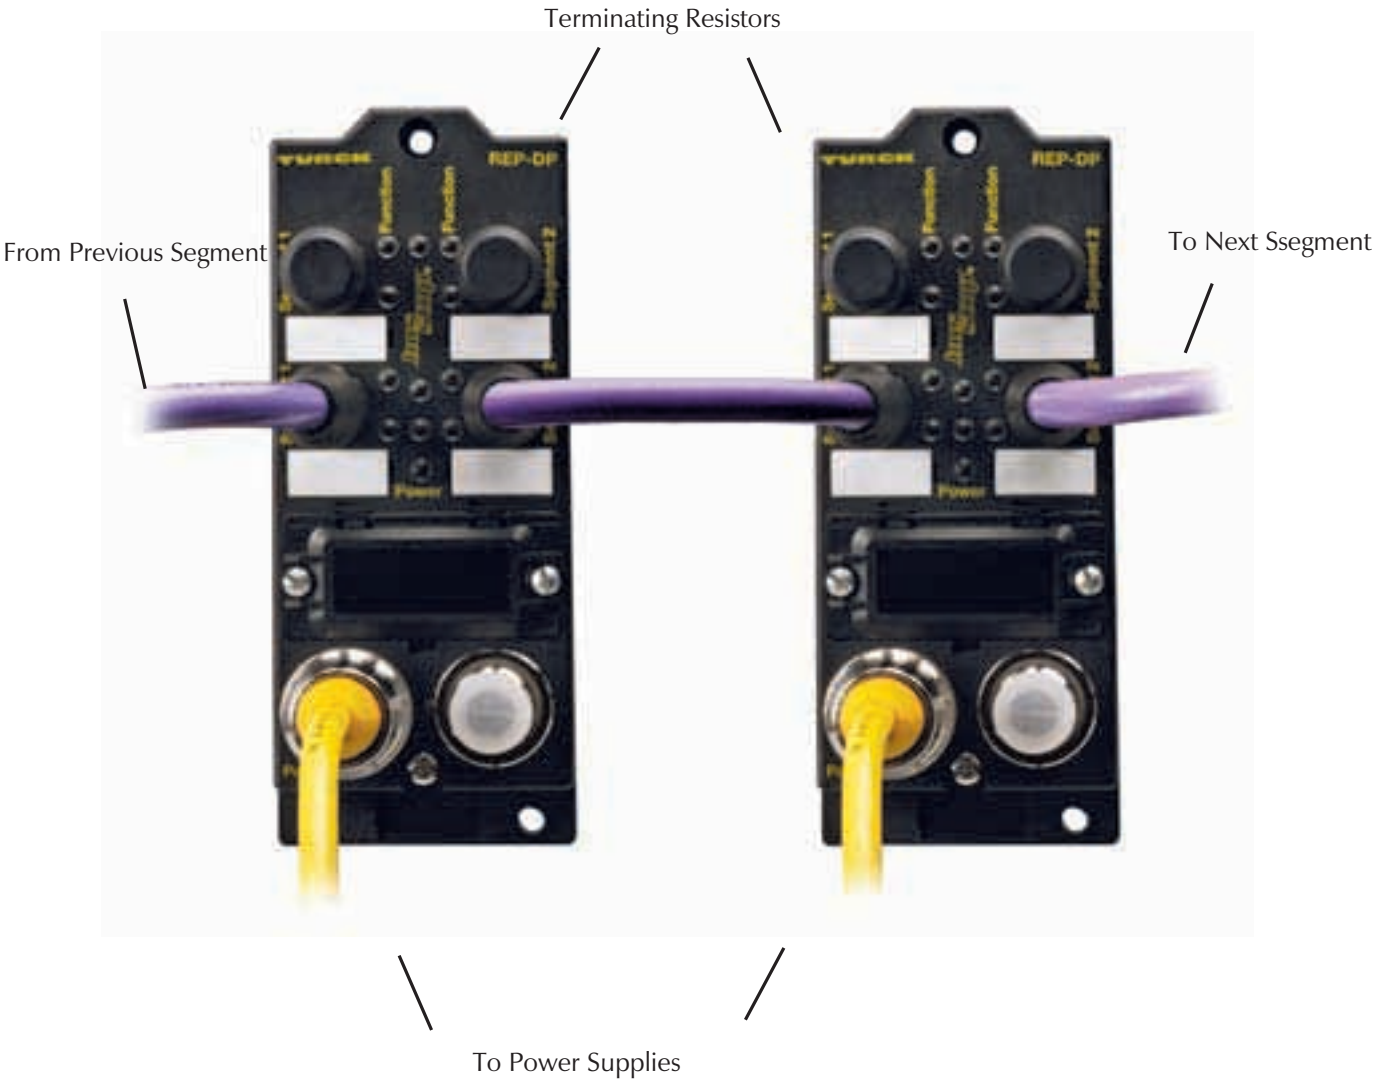
PROFIBUS®-DP Repeater

The **REP-DP** repeater serves to assemble two galvanically isolated PROFIBUS-DP segments in RS-485 technology with 32 participants each, and provides IP 67 protection. Up to four repeaters can be connected in series, so that up to 127 nodes can be operated via a single master; thus PROFIBUS networks can be extended significantly by using repeaters (depending on the baud rate).
The transmission rate is detected automatically (up to 12 Mbaud), and the signals are regenerated in amplitude. If there are faulty protocols in one of the segments (a wire-break, short-circuit in the bus line or by a defective node), that segment is decoupled and an error indication is provided by the LED.

Connection:

Individual PROFIBUS segments are connected via M12 connectors (see technical guidelines for PROFIBUS connection technology). The repeater is equipped with three female and one male connector; unused connections must be terminated with a terminating resistor (type: RSSW 45-TR). The shield of the PROFIBUS cable can be grounded directly via a grounding screw (internally the shield is coupled capacitively with the ground). Power (24 VDC) is supplied via standard 7/8 inch connectors.



Profibus-DP Repeater

REP-DP-0002

- **Extend Network Length**
- **Extend Drop Lengths**
- **Allows More Than 32 Stations on Network**
- **Isolate Communication Segments**

Electrical

- Operating Current: <60 mA

Power Distribution

- Station: Auxiliary power supply (U_B)

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: NEMA 1,3,4,12,13 and IEC IP 67
- Vibration: 50 g @ 10-500 Hz

Material

- Connectors: Nickel-plated brass
- Housing: Nylon 6

Diagnostics (Physical)

- LEDs indicate communication status for each segment and power supply

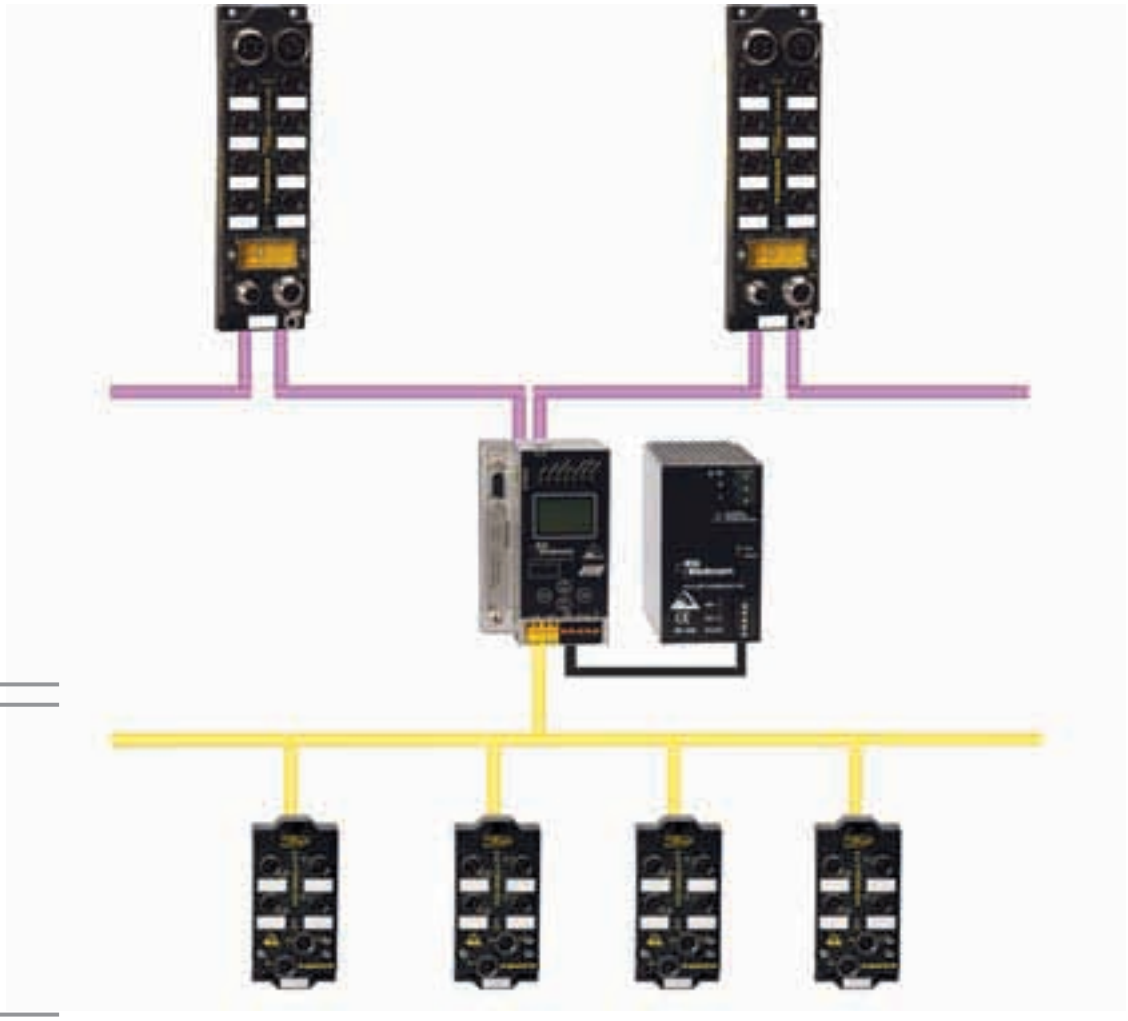
PROFIBUS-DP to AS-interface Gateways

AS-I systems can be easily connected to a higher-level network, like PROFIBUS, through a gateway master. The gateway acts as a master to the AS-I system(s) and a slave to the PROFIBUS system, mapping all of the AS-I data for PROFIBUS in a single block.

For AS-I specifications and rating details see section G of this catalog.

PROFIBUS-DP System
(Gateway is the Slave)



AS-I System
(Gateway is the Master)

Addressing

PROFIBUS® stations must have a network address for communication. The address for AS-I/ PROFIBUS gateways may be set via the on-unit display and push buttons. Please consult the manual for a particular gateway for instruction on the procedure.

Diagnostics

AS-I/ PROFIBUS gateways contain LEDs for diagnosing I/O and communication problems for AS-I and PROFIBUS. For a detailed description of the LED states please see the Bihl+Wiedemann AS-I/ PROFIBUS Gateway User Manual available for download from www.bihl-wiedemann.com.

Power

Most AS-I/ PROFIBUS gateways draw power from the AS-I power supply. The option to use a separate, non-AS-I power supply is also available. Consult the gateway documentation to ensure that the gateway being selected meets the requirements of your system.

PROFIBUS®-DP BL67 Stations

TURCK's BL67 is a modular, user configurable network I/O system designed to allow installation of nodes containing different types and sizes of I/O depending on the users needs for a particular area. Featuring IP 67 protection and metal threaded connectors, the BL67 can often be mounted in the physical process environment or directly on a machine without a separate enclosure for the I/O. This saves planning and installation time, as well as the cost of the enclosure itself.

The BL67 system supports several different network protocols, including PROFIBUS-DP. A BL67 station consists of a gateway module that interfaces to the PROFIBUS system, and several I/O modules that interface with the physical I/O in the field. Different connector options are available to allow a greater level of customization to the user.

For more details on the BL67 system, please see section G of this catalog.

TURCK's I/O Assistant software package is used to configure the BL67 system.

PROFIBUS®-DP BL20 Stations

TURCK's BL20 is a modular, user configurable network I/O system designed to allow installation of nodes containing different types and sizes of I/O depending on the users needs for a particular area. Featuring IP 20 protection and terminal point connections, the BL20 is intended to be mounted in the control cabinet or in a field enclosure.

The BL20 system supports several different network protocols, including PROFIBUS-DP. A BL20 station consists of a gateway module that interfaces to the PROFIBUS system, and several I/O modules that interface with the physical I/O in the field. The terminal bases are available with tension clamp or screw terminal connector types.

For more details on the BL20 system, please see section H of this catalog.

TURCK's I/O Assistant software package is used to configure the BL20 system.

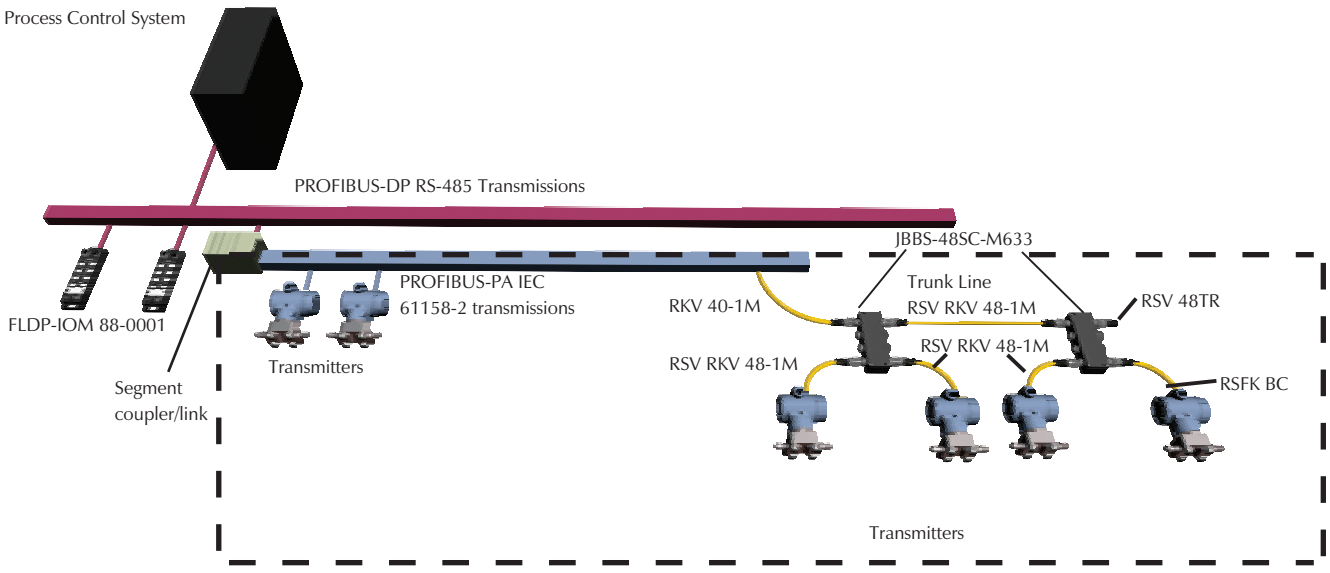
PROFIBUS®-PA Media Overview

PROFIBUS-PA (Process Automation) uses synchronous transfer mode technology, as defined in IEC 61158-2, to communicate between field devices and the RS 485 backbone of PROFIBUS®-DP. A segment coupler, or gateway is installed to bridge PROFIBUS-DP with PROFIBUS-PA. Otherwise, the protocols are identical, allowing transparent communication between general purpose automation systems and decentralized field devices.

PROFIBUS-PA is a master-slave bus. Transmitters used in the process industry are typically slave devices or passive stations which only communicate at the request of the master.

General Layout Topologies

The topology for PROFIBUS-DP is a linear bus. Branching can be accomplished with repeaters or, in the case of PROFIBUS-PA, this can be accomplished with the segment couplers. The PROFIBUS-PA topology follows the physical layer as defined in ISA SP50.02. Daisy chain or star topologies are allowed.



PROFIBUS®-PA, Cable Specifications

- **Cable that Meets the Requirements of ISA/SP50 and PROFIBUS-PA Requirements for Type A Cable**
- **All Cables are Rated -40° to +105°C and are Sunlight Resistant**
- **Available in 3-wire Versions with a Device Ground or 2-wire Versions**

Type A Cable Specifications

- Designed for harsh environments
- Temperature range: -40° to +105°C
- Governed by: ISA SP50.02 specification
- Sunlight resistant per test
- PLTC and ITC rated (CSA FT4)
- Impedence [Z_0 at f_r (31.25 kHz)] = 100 Ohms $\pm$ 20 %
- Maximum attenuation at 1.25 f_r (39 kHz) = 3.0 dB/km
- Maximum capacitive unbalance to shield = 2 nF/km
- Maximum DC resistance (per conductor) = 24 Ohms /km
- Maximum propagation delay variance 0.25 f_r to 1.25 f_r = 1.7 µs/km
- Conductor cross-sectional area (wire size) = nominal 0.8 mm^2 (#18 AWG)
- Minimum shield coverage shall be 90%.

DeviceNet™ System Description

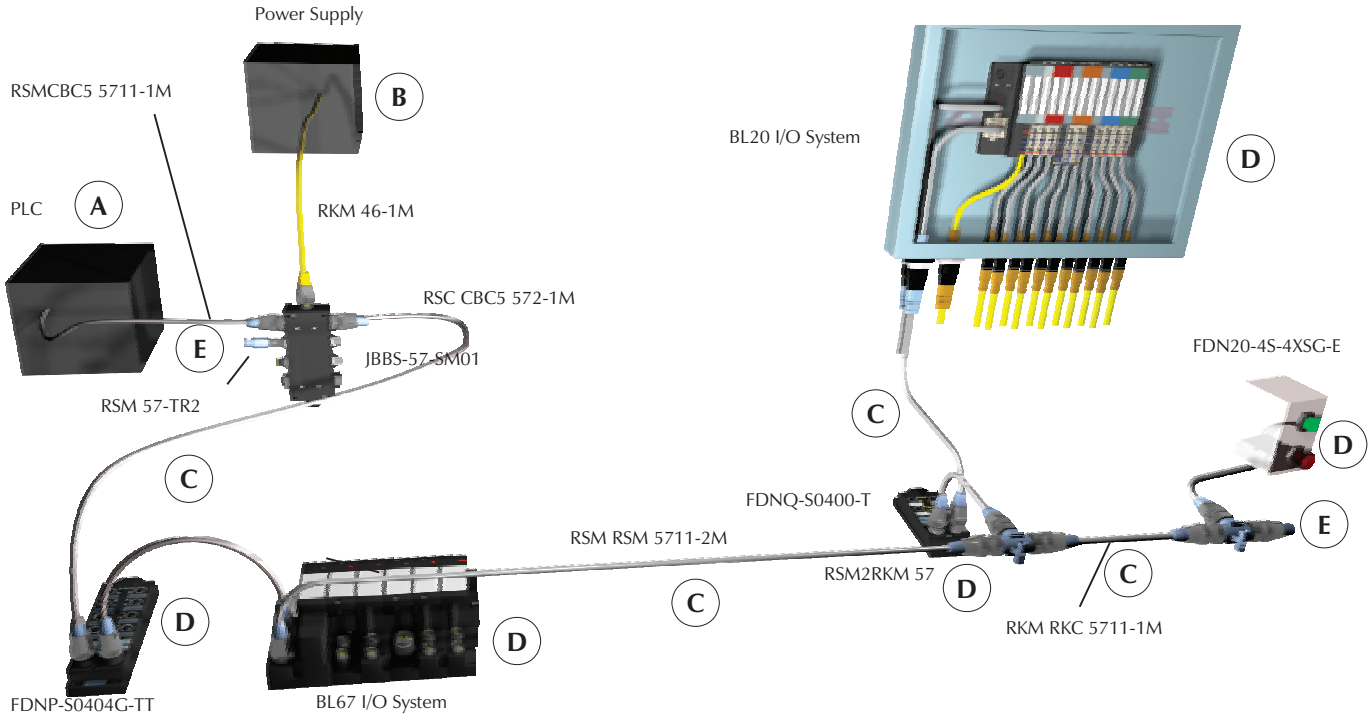
DeviceNet is a low-cost communications protocol that eliminates hard wiring and connects industrial devices such as limit switches, photoelectric sensors, valve manifolds, motor starters, process sensors, bar code readers, variable frequency drives, panel displays and operator interfaces to a network. DeviceNet's direct connection provides improved communication between devices, as well as important device-level diagnostics not easily accessible or available through hard-wired I/O interfaces.

DeviceNet is based on the Controller Area Network (CAN) broadcast-oriented communication architecture. CAN uses a bus arbitration method, CSMA/BA, that assures the highest priority message always gets use of the bus in the event of a data collision. The DeviceNet protocol further defines message priorities such that I/O messages are given top priority and configuration messages have lower priority.

A DeviceNet network supports up to 64 nodes and virtually an unlimited amount of I/O. The bus uses a trunkline/dropline topology, where bus power and communication are supplied on a single cable. Bus power is 24 VDC and supplies current to operate the nodes and (typically) power input devices. Some **TURCK** stations require an additional 24 VDC auxiliary power to supply current for outputs.

DeviceNet allows peer-to-peer data exchange (where a DeviceNet node can initiate communication with other nodes or peers), and a master/slave configuration in which the master node initiates all communication and all other nodes, or slaves, respond to the master node's requests.

Typical System Configuration



Basic Part List

A typical DeviceNet system consists of the following parts:

- A - Controller
- B - Power Supply
- C - DeviceNet Cable
- D - DeviceNet I/O Modules (or Slaves)
- E - Terminating Resistors

DeviceNet stations require a network master (also called a scanner) to interface the stations to the host controller. **TURCK** DeviceNet stations are designed to be fully compatible with DeviceNet equipment from other manufacturers.

Cordsets

TURCK offers a complete line of molded DeviceNet cordsets to facilitate network installation, resulting in a faster start-up and fewer wiring errors. The bus and drop cables are specially designed foil-shielded, high-flex cables with very low inductance and capacitance to minimize propagation delay time. DeviceNet cables consist of a shielded and twisted data pair, as well as a shielded and twisted power pair for the 24 VDC bus power, with an additional outer shield. The 24 VDC power pair provides bus power to the station's communication electronics and (typically) to input circuits.

The data lines for CAN-High and CAN-Low differential signals conform to the CAN standard, and support network data exchange at the maximum transmission speed of 500 kbps.

In most cases, bus cable connections are made using 5-pin ***minifast***® (7/8-16 UN) or ***eurofast***® (M12) connectors. A variety of stations are also available that support terminal-block type connections. Stations with output circuits for DC actuators normally require 24 VDC auxiliary power fed through a separate connection from the communication bus.

TURCK cordsets for the DeviceNet system are available in standard lengths. Contact your local sales representative to order custom lengths.

Diagnostics

TURCK stations provide increased diagnostics when used with standard proximity or photoelectric sensors and discrete actuators. **TURCK** stations also serve as a buffer between I/O devices and the DeviceNet bus by detecting short-circuits without disrupting DeviceNet communication.

For deluxe style stations, each I/O point on the station provides state and status data. State data represents the real world value of the I/O device; for example, when the sensor is on or the actuator is off. Status data indicates short-circuits in the I/O device or in the wiring between the device and the station. Some models also use status data to indicate open circuits.

State and status data are transferred to the DeviceNet scanner where it is available for fault handling in the control program. Additionally, each input and output has a multicolored LED to indicate its state and status and pinpoint I/O problems quickly; for example the module status LED indicates the internal health of the station, and the network status LED indicates the station's communication on the DeviceNet network.

Addressing

The valid range of DeviceNet node addresses is 0 to 63. The station's default node address is 63. Each node's address must be initially set, usually via rotary dials or switches on the node. The address can also be set with a DeviceNet configuration tool.

Changes to the address settings take effect when the station power is cycled. Care must be taken to prevent the same address from being assigned to more than one node in a system. If the same address is set on multiple nodes, one node will take control of the address and the others will go into "Critical Link Failure" state, indicated by the network status LED (solid red).

Communication Rate/Cycle Time

DeviceNet™ specifications define three transmission speeds: 125, 250 and 500 kbps. All nodes on a network must communicate at the same rate.

Several factors must be considered when calculating the complete cycle time of a DeviceNet system, including:

- Number of nodes being scanned
- Amount of data produced and consumed by the nodes
- Type of I/O messaging (change of state, strobe, poll)
- Network communication rate
- Device time-out and explicit messaging traffic
- Cycle time of the control program

Electronic Data Sheets (EDS) Files

Electronic Data Sheets, or EDS files, are files that contain detailed information about a DeviceNet device, including I/O data size and the device's configurable parameters. The information provided by EDS files guide a user through the steps necessary to configure a device. EDS files are available on the **TURCK** web site (www.turck.com).

Maximum Ratings

The DeviceNet bus uses trunk and drop topology. The trunk is the main communication cable, and requires a 121 ohm resistor at both ends of the trunk. The length of the trunk depends on the communication rate and the cable type. Drops are branches off the trunk, and may be from zero to 6 m (20 ft) in length. The cumulative drop lengths are dependent on the communication rate. The following table shows the maximum ratings for a trunk using thick, mid and thin cable. Thick and thin DeviceNet communication cable types are defined by the DeviceNet specification; mid cable is a hybrid of the two that is offered by **TURCK**.

Communication Rate	Thick Trunk Length (maximum)	Mid Trunk Length (maximum)	Thin Trunk Length (maximum)	Drop Length (maximum per drop)	Drop Length (cumulative)	Nodes (maximum)
125 kbps	500 m (1640 ft.)	300 m (984 ft.)	100 m (328 ft.)	6 m (20 ft.)	156 m (512 ft.)	64
250 kbps	250 m (820 ft.)	250 m (820 ft.)	100 m (328 ft.)	6 m (20 ft.)	78 m (256 ft.)	64
500 kbps	100 m (328 ft.)	100 m (328 ft.)	100 m (328 ft.)	6 m (20 ft.)	39 m (128 ft.)	64

DeviceNet™ AIM™ Stations

TURCK's Advanced I/O Module (AIM) DeviceNet stations are extremely rugged stations designed for machine mounting. These stations allow easy connection of standard I/O devices (such as sensors, limit switches, valves and pilot lights) to a DeviceNet network, typically without a protective enclosure. This is made possible by epoxy-filled station housings, all-metal connectors and visible rotary address switches, among other things.

Specifications

Mechanical

TURCK DeviceNet AIM stations are designed for machine mounting with no separate enclosure or housing necessary. Quick-disconnect capability, combined with an epoxy-filled housing, creates an extremely durable station that can be mounted in most industrial environments. Detailed environmental specifications are as follows:

- Housing material: Glass filled nylon
- Connector material: Nickel-plated brass
- Protection level: NEMA 1,3,4,12,13; IEC IP 67
- Operating temperature: SE stations -40 to +70°C (-40 to +158°F); LX stations -25 to +70°C (-13 to +158°F)
- Vibration: 50 g @ 10-500 Hz

Other housing and connector materials available upon request.

The stations components are identified in the following figure. The figure shows a station with ***minifast*** ® (7/8-16 UN) network connectors, but other connector options (such as M12 ***eurofast*** ®) are available for some stations. Stations with all I/O powered from the DeviceNet power supply do not have the auxiliary power connectors at the top of the housing.

Connectors

DeviceNet™ AIM™ stations generally provide connections for the bus and I/O, in addition to auxiliary power for stations with outputs.

Bus Connectors

minifast ® (7/8-16UN) is the standard bus connector for DeviceNet AIM stations. Some stations are available with ***eurofast*** ® (M12) or M23 bus connectors.

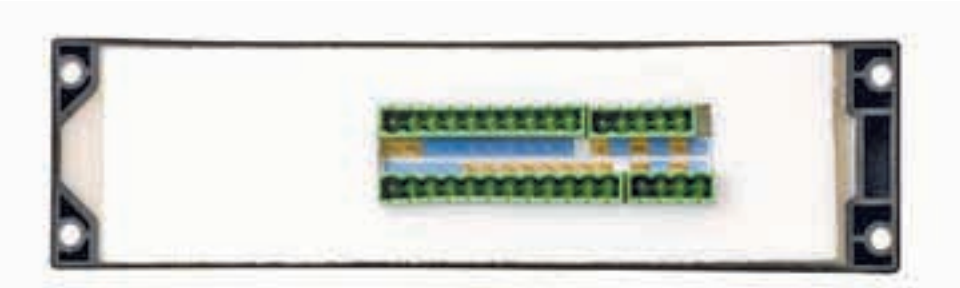
AIM™ stations with part numbers ending in "ST" support screw terminal I/O and bus connections. The screw terminals for these stations are located on the back of the station. The back of the station is also fitted with a foam gasket to allow the station to be mounted to the outside of a cabinet or field I/O box (i.e. motor control center).

Auxiliary Power Connectors



Stations where I/O draws a significant amount of current (2 Amp outputs, for example) receives this power from a second, or auxiliary, power supply. Some stations receive input power from the network and output power from the auxiliary supply. Generally, the connection is a male/female pair to allow cabling one power supply to multiple stations without the use of a tee (daisy chain configuration). Auxiliary power is typically supplied by a 4-pin ***minifast*** ® (7/8-16 UN) connector, though other auxiliary power connections are used on some stations. For further details see the individual station entries in this catalog.

Aux. Power Pinout

Male	Female
	
4-Pin	4-Pin

1 = V_{AUX}+
2 = Pass Through
3 = Pass Through
4 = V_{AUX}-

Power

Some AIM stations (typically those with only inputs) are completely powered from the DeviceNet power supply. When designing a network, take care to include the current draw for the station, as well as all input devices connected to the station in your power supply sizing calculations. For example, if the internal current consumption of the station is <50 mA and the total short-circuit limit for all inputs combined is <700 mA, then the maximum current draw for the station is 50 mA + 700 mA = 750 mA.

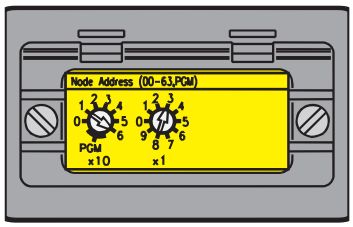
Stations with output points normally use a separate auxiliary power supply to provide current for the outputs. Several AIM stations can be powered by one auxiliary supply, or a single supply for each station can be used.

Common power ratings for AIM stations include:

- Bus (DeviceNet) Voltage: 11-26 VDC
- Aux Power Voltage: 24 VDC (nominal, supported stations)
- Input Voltage: 13-26 VDC (From DeviceNet supply)
- Input Signal Current (each input): OFF <2 mA; ON 3.0-3.4 mA (@ nominal 24 VDC)
- Input Delay: 2.5 ms

Addressing

DeviceNet™ stations must have a network address for communication. The address for AIM stations may be set via the visible rotary switches under the clear plastic cover on the front of the station.



Address = 6x10 + 3x1 = 63

The pair of switches represents the address as a decimal number; the left switch being the 10's multiplier and the right switch the 1's multiplier. To program the station, rotate the switches with a small slotted screwdriver until the arrows on the switch point to the appropriate numbers for the chosen address.

Some stations (LX style with extended diagnostics) have a third switch. This switch is used to set the communication baud rate for the station. When set to the AUTO position, the station automatically senses the baud rate of the network. SE style stations only use the autobaud setting.

Parameters

Many DeviceNet configuration tools support the use of EDS driver files to configure nodes and set various parameters. Some of the user settable parameters available for AIM stations are:

Parameter Name	Description	Valid Values	Default
Baud Rate	Defines the baud rate for the station to use if Autobaud is disabled	125kB; 250kB; 500kB	125kB
Autobaud	If enabled the station automatically senses the baud rate	Enable; Disable	Enable
Connection Mode	Set to UCMM to use unconnected messaging	Predefined M/S Connection; UCMM	Predefined M/S Connection
Quick Connect	Set to enable fast startup connection to DeviceNet (QuickConnect)	Enable; Disable	Disable

Consult the documentation for the DeviceNet configuration tool you are using for details on how to access device parameters via EDS files.

Diagnostics

AIM™ stations provide two LEDs for diagnosing communication problems.

Module Status

- Green: Working properly
- Flashing green: Detecting baud rate
- Flashing red: Input short-circuit

Network Status

- Green: Connection established
- Flashing green: Waiting for connection
- Flashing red: Connection timed out
- Red: Cannot connect

There is an additional LED for each I/O point on the station. This LED indicates:

- Off: Point is off
- Green: Point is on
- Amber: Point is in open circuit state (advanced diagnostic stations only)
- Red: Point is in short-circuit state (advanced diagnostic stations only)

For SE style (group diagnostic) stations there is also a single bit communicated to the controller for diagnostic purposes. This bit is on if any input on the station is in the short-circuit condition, and off if all inputs are operating normally.

LX style (extended diagnostic) stations indicate the diagnostic status of each I/O point on the station, with an extra bit to indicate if the point is short or open circuited. These diagnostic bits can be disabled via the EDS parameter settings.

Connecting Devices to an AIM Station

AIM stations typically provide a ***eurofast***® (M12) connection for each I/O point. Standard **TURCK** I/O cordsets can be used to connect physical devices in the field to the AIM station. Some AIM stations, specifically those with I/O counts greater than eight total points, connect two signals to each connector. If the signals being connected are on the same physical device (for example a sensor with two outputs), a simple four or five-wire cordset can be used for connection (Figure 1) on the next page.

Extended Diagnostic

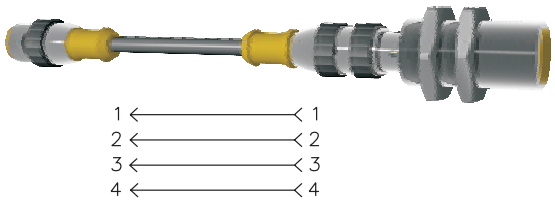
I = Input
O = Output
ISS = Input Short Circuit Status
IOS = Input Open Circuit Status
OS = Output Status
APS = Auxiliary Power Status

If the signals are on two separate devices, a splitter can be used to separate the AIM™ I/O connector into two individual ***eurofast***® connectors. The recommended splitter is wired such that the second signal pin on the AIM station (pin 2) is wired to the default signal pin (pin 4) on the second splitter arm - requiring no special wiring by the user. The splitter is simply plugged into the AIM I/O connector and each arm is plugged into the appropriate I/O devices, as shown (Figure 2).

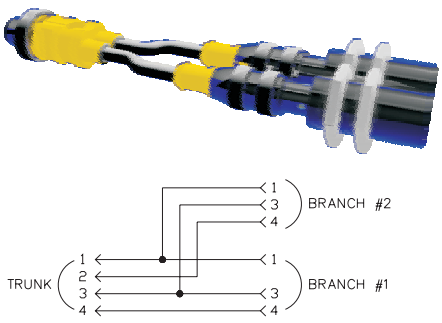
Figure 1

AIM stations provide a wide range of connection options depending on the I/O count and type being used. The user should be aware of the I/O pinout being used.

Figure 2



For one input per connector use standard cordsets, for example RK 4.4T-1-RS 4.4T



For two inputs per connector use a splitter, for example VBRS 4.4-2RK 4T-1/1

Standard Input/Output Station

FDNL-CSG88-T
FDNL-CSG88-T-V

- **Rugged, Fully Potted Stations**
- **IP 67, IP 68, IP 69K Protection**
- **Input and Output on Same Connector**
- **Automatic Baud Rate Sensing**

Electrical

- Operating Current: <100 mA plus sum of I/O currents (from DeviceNet)
- Sensor Current: <700 mA sum of all inputs (from DeviceNet)
- Output Current: <500 mA per output (from DeviceNet)

Power Distribution

- Inputs: DeviceNet power supply
- Outputs: DeviceNet power supply

Mechanical

- Operating Temperature: -40 to +70°C (-40 to +158°F)
- Protection: NEMA 1,3,4,12,13 / IEC IP 67, IP 68, IP 69K
- Vibration: 50 g @ 10-500 Hz

Material

- Connectors: Nickel-plated brass (stainless steel available on request)
- Housing: Nylon 6 (other materials available on request)

Diagnostics (Logical)

- Open/short-circuit status mapped to DeviceNet I/O table, one bit indicates a fault for all inputs, one bit for all outputs

Diagnostics (Physical)

- One LED indicates I/O fault for entire station
- LEDs to indicate status of DeviceNet communication

Deluxe Input/Output Station

- **Rugged, Fully Potted Stations**
- **IP 67, IP 68, IP 69K Protection**
- **Auxiliary Powered Outputs**
- **Automatic Baud Rate Sensing**

FDNP-P1204G-TT

Electrical

- Operating Current: <100 mA plus sum of input currents (from DeviceNet)
- Sensor Current: <80 mA per input (from DeviceNet)
- Output Current: <0.5 A per output (from Auxiliary power)

Power Distribution

- Inputs: DeviceNet power supply
- Outputs: Auxiliary power supply

Mechanical

- Operating Temperature: -25 to +70°C (-13 to +158°F)
- Protection: NEMA 1,3,4,12,13 / IEC IP 67, IP 68, IP 69K
- Vibration: 50 g @ 10-500 Hz

Material

- Connectors: Nickel-plated brass (stainless steel available on request)
- Housing: Nylon 6 (other materials available on request)

Diagnostics (Logical)

- Open/short-circuit status mapped to DeviceNet I/O table, one bit for each I/O point

Diagnostics (Physical)

- Individual LED to indicate open/short-circuit for each channel
- LEDs to indicate status of DeviceNet communication

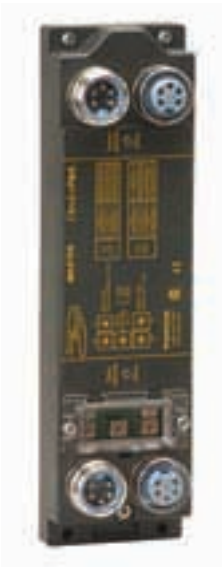
DeviceNet Master



FDN-MSTR-1220

- **Used to Manage a Sub-Network**
- **Manages 8-nodes on Sub-Network**

Electrical

- Bus Power: 11-30 VDC
- Current Consumption: 125 mA (Slave), 30 mA (Master)

LED Indication

- Slave Network Status: Flashing Green: Ready for connection
  Green: Established connection
  Flashing Red: Connection time out
- Master Network Status: Flashing Green: Ready for connection
  Green: Connected to all stations
  Flashing Red: Time out with one or more stations
  Red: Connection not possible

Adjustments

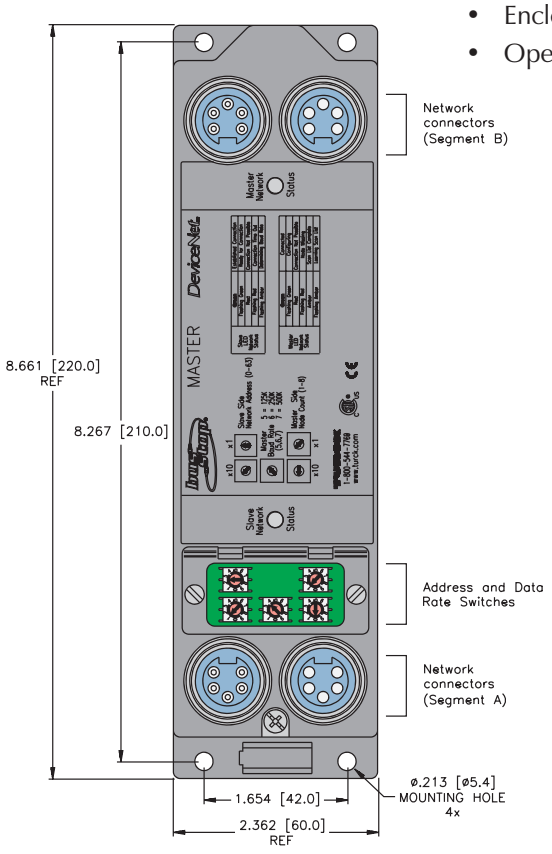
- Slave Side (Network address): 0-63 via rotary switches
- Master Side (Node count): 0-8 via rotary switches
- Master Baud Rage (5,6,7): 5=125 K, 6=250 K, 7=500 K

Connections

- Bus Line: 5-pin ***minifast***® connectors

Housing

- Material: Glass filled nylon with nickel plated brass connectors
- Enclosure: NEMA 1,3,4,12,12 and IEC IP 67, 68 and 69K
- Operating Temperature: -25° to 70° C (-13° to 158° F)



Note: each segment has one male and one female connector

The FDN-MSTR is a DeviceNet™ master used to manage a subnet off of the main DeviceNet network.

Main DeviceNet Network

The subnet to the FDN-MSTR is a DeviceNet network terminated on both ends and is limited to 8 nodes with addresses that must be in sequential order from 1 to 8. The baud rate for this network is determined by the rotary switch setting on the FDN-MSTR.

DeviceNet SubNetwork

The subnet to the FDN-MSTR is a DeviceNet network terminated on both ends and is limited to 8 nodes with addresses that must be in sequential order from 1 to 8. The baud rate for this network is determined by the rotary switch setting on the FDN-MSTR.

The slaves on the subnet are independent of the main DeviceNet network. Hence a node 4 on the main network will conflict with a node 4 on the sub network.

I/O Data Map 1

The Input data size is 64 bytes (where the first two bytes are reserved for status information from the FDN-MSTR).

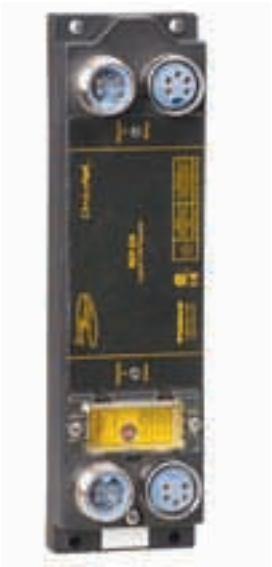
	Byte	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
In	0	-	-	-	-	-	-	-	-	-	-	-	-	-	-	IC	-
	1	ESN 8	ESN 7	ESN 6	ESN 5	ESN 4	ESN 3	ESN 2	ESN 1	RSN 8	RSN 7	RSN 6	RSN 5	RSN 4	RSN 3	RSN 2	RSN 1
	2	Node Address 1 Input Data															
	3	Node Address 2 Input Data															
	…	…															
	N	Node Address X Input Data															

The Output data is 64 bytes.

	Byte	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Out	0	Node Address 1 Output Data															
	1	Node Address 2 Output Data															
	2	Node Address 3 Output Data															
	…	…															
	N	Node Address X Output Data															

IC = Invalid configuration of node missing: 0 means OK, 1 means error.
ESNX = Error on sub node X: 0 means OK, 1 means error communicating with node.
RSNX = Registered sub node X: 0 means no node is present, 1 means that node is present.
The data table for the Input and Output show the last Byte as "N". This "N" is variable depending on the total amount of data generated by all the nodes on the deviceNet™ sub network. However the maximum for both the Input and the Ouptut are 64 bytes.

DeviceNet Repeater



REP-DN
REP-DN-DROP

- **Extend Network Length**
- **Extend Drop Lengths**
- **Isolate Power Segments**
- **Isolate Communication Segments**

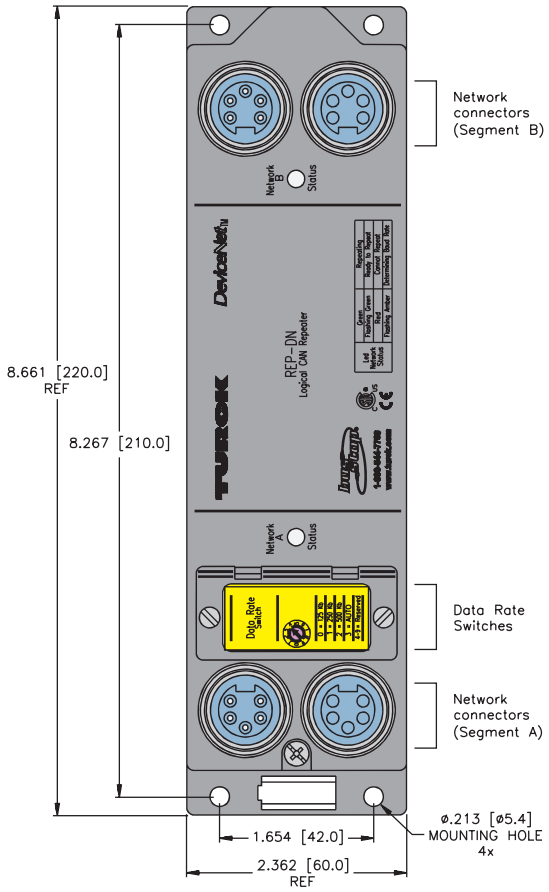
Electrical
- Operating Current: 125 mA from segment A, 30 mA from segment B

Power Distribution
- REP-DN: DeviceNet power supply for each segment (must be powered by separate supplies)
- REP-DN-Drop: Does not require a separate power supply and does not isolate power between segments

Mechanical
- Operating Temperature: -40 to +70°C (-40 to +158°F)
- Protection: NEMA 1,3,4,12,13 and IEC IP 67
- Vibration: 50 g @ 10-500 Hz

Material
- Connectors: Nickel-plated brass (stainless steel available on request)
- Housing: Nylon 6 (other materials available on request)

Diagnostics (Physical)
- One LED for each segment to indicate communication status



Note: each segment has one male and one female connector

DeviceNet™ Repeater

The **REP-DN** is a potted, fully connectorized rugged repeater that can be mounted directly on the machine. It is designed for use on any Controller Area Network (CAN), including DeviceNet. Network segments connected by a repeater are considered separate physical networks (trunk and drop lengths for each segment are determined as if the other segments are not there), but one logical network (addresses cannot be duplicated - the scanner and configuration tools work as a single network).

A repeater does not consume an address and is invisible to all the other devices on the network. A repeater does not have an EDS file. The **REP-DN** repeater can be used to extend either the trunk or drop lines, and to isolate power supplies on networks with multiple supplies. There is no limit to the number of repeaters that can be used on one network.

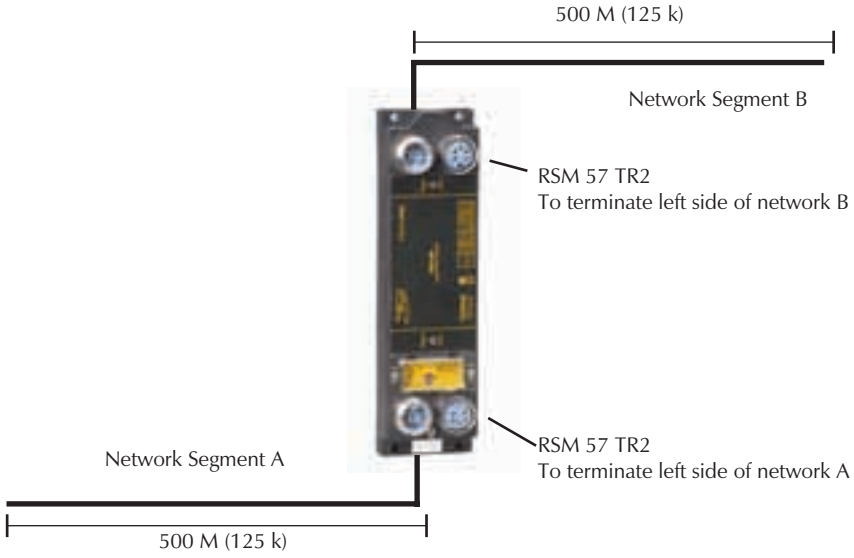
A repeater's baudrate is set via a rotary switch. The baudrate on each side of the repeater must be the same, as different rates would cause the "slow" side to be overloaded with messages from the "fast" side. When a message is repeated, a 2 ms delay is introduced. This is typically insignificant compared to the overall scan time of the network. If more than four repeaters are used in series, the interscan delay may need to be increased.

Repeater Configurations

Extended Trunk Line

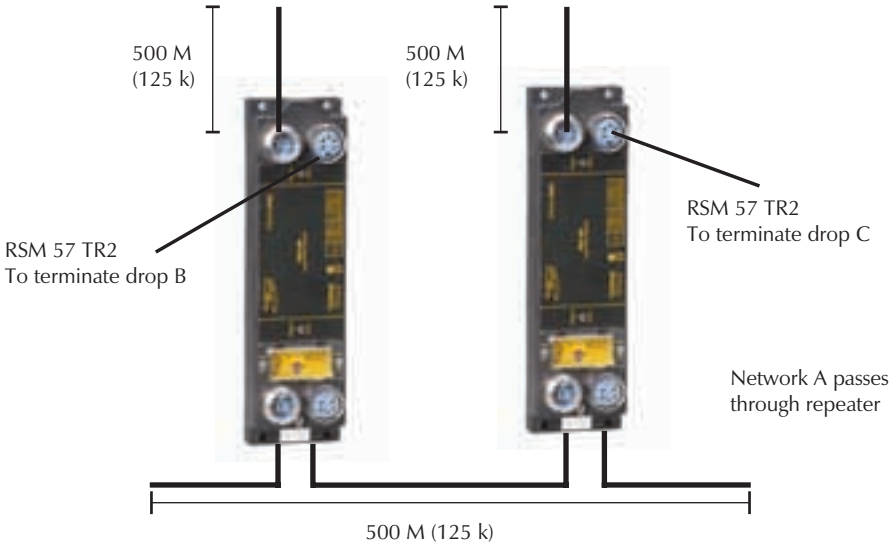
Repeaters are connected in series to extend the trunk line. The total delay is 2 ms multiplied by the number of repeaters.

* REP-DN-DROP does not require a separate power supply on segment B. If a separate power supply is desired, it must be attached using a "Power T" (RSM RKM 57 WSM 40 PST recommended).



Extended Drop Line

Repeaters are connected in parallel to extend the drop length. The overall network delay is 2 ms, because there is only one repeater between the scanner on the trunk and any other device.



Do Not Create a Ring

While a repeater can be used to create very large and complex networks, some configurations are not permitted. If a ring is created (both sides of a repeater are connected to the same network), the repeater will continuously repeat to itself, causing the network to overload.

DeviceNet Spanner

FDN-DN1

- **Rugged, Fully Potted Stations**
- **IP 67 Protection**
- **Communicate Between PLCs**
- **Connect Two DeviceNet Networks**

Electrical

- Operating Current: 125 mA from segment A, 30 mA from segment B

Power Distribution

- Station: DeviceNet power supply for each segment (must be powered by separate supplies)

Mechanical

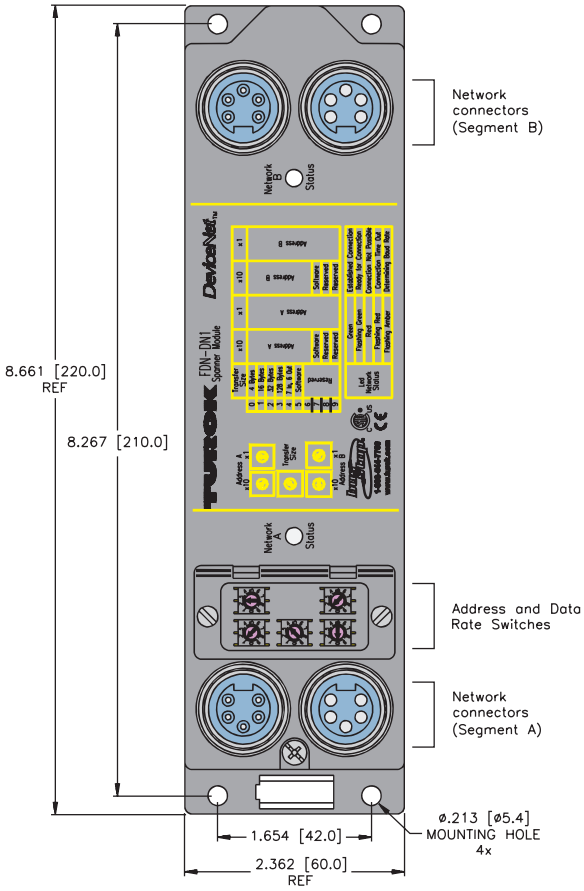
- Operating Temperature: -40 to +70°C (-40 to +158°F)
- Protection: NEMA 1,3,4,12,13 and IEC IP 67
- Vibration: 50 g @ 10-500 Hz

Material

- Connectors: Nickel-plated brass (stainless steel available on request)
- Housing: Nylon 6 (other materials available on request)

Diagnostics (Physical)

- One LED for each segment to indicate communication status



1 = Shield
2 = V+
3 = V-
4 = CAN_H
5 = CAN_L

DeviceNet™ Spanner

The FDN-DN1 "Spanner" module provides a means to route data between two PLC's using DeviceNet. The spanner eliminates the need for a high level control network pyramid, by connecting the DeviceNet networks directly. This simple approach is extremely powerful and economical. It is simple because the spanner appears to each PLC as a standard rack of I/O; any DeviceNet scanner can send I/O data to the spanner without additional software or complex configuration procedures. It is powerful because it can transfer up to 128 bytes of data in one message. It is economical because it replaces the high level control network, eliminating two control cards, wiring, conduit and programming.

Theory of operation

The spanner transfers data between PLC A and PLC B by appearing as I/O to each PLC. The spanner immediately copies the output data from PLC A to the input data for PLC B. Similarly, PLC B's output data is copied to PLC A's input data. The size of data transferred is set by the transfer size switch. If the transfer size switch is set at 4,16, 32 or 128 bytes, then the size of the data transferred is the same in both directions. If the transfer size switch is set to software, then the transfer size is set via software and it can be any size (0,1,2,3...128 bytes). When in software mode, the data size mapped to the PLC must be equal in opposite directions on either side of the spanner. For example, if side A produces 2 input bytes and consumes 12 output bytes, then side B must be set to produce 12 input bytes and consume 2 output bytes.

Electrically

The spanner optically isolates network A from network B; the networks do not interact electrically in any way. The spanner is powered internally by network A; a power reset on the A side will reset the entire station.

Addressing

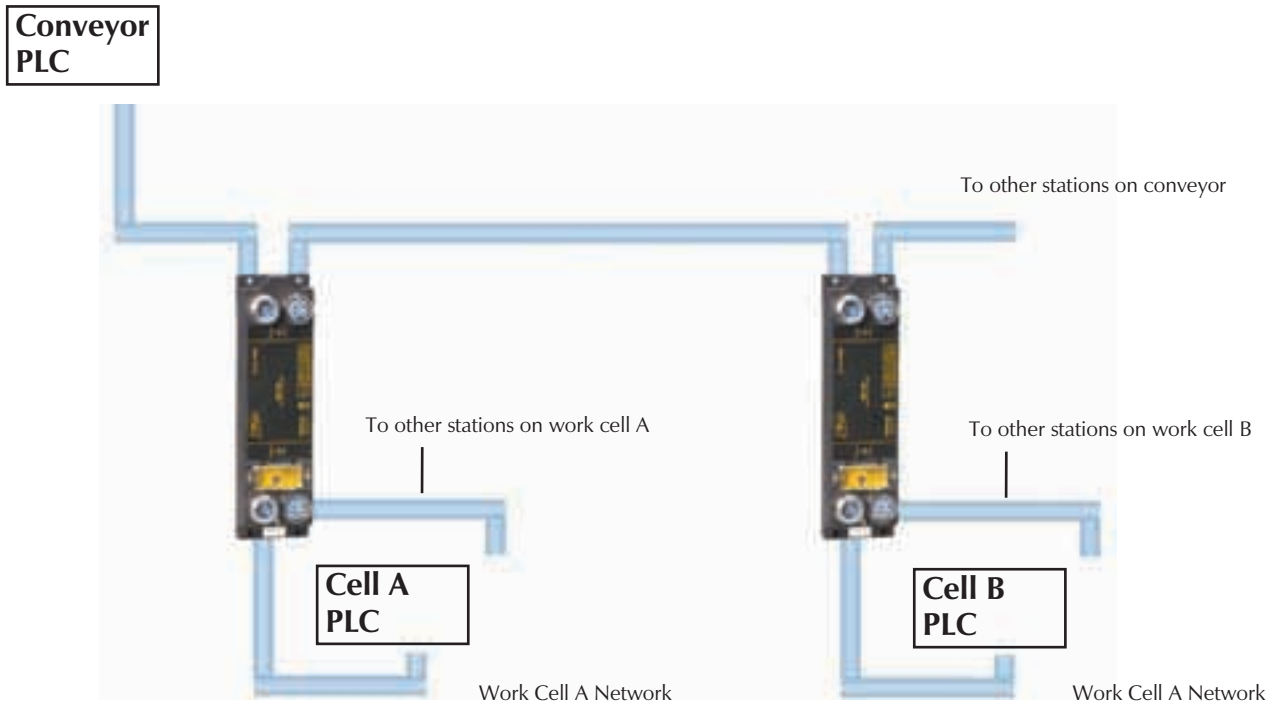
Because the spanner is essentially two DeviceNet devices, one on network A and one on network B, it has two sets of address switches. The address switches for network A are completely independent of network B.

Baudrate

The spanner automatically detects the Baudrate at startup. Network A and B may be at different baudrates.

Spanner Topology

The spanner is typically used to correct and coordinate multiple work cells.



DeviceNet FDN20 Stations

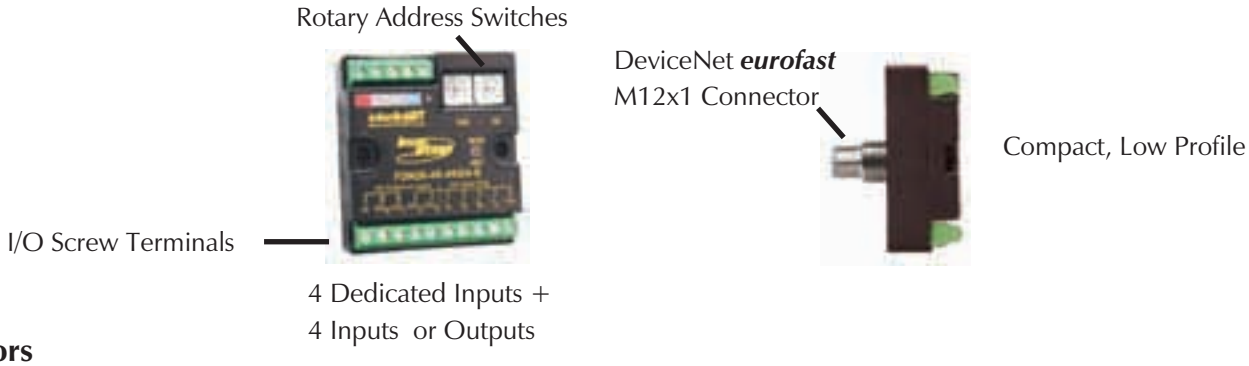
TURCK's FDN20 DeviceNet stations are low-cost screw-terminal connection stations designed for mounting in an enclosure. These stations allow you to easily connect standard I/O devices such as push buttons, pilot lights, motor starters and drives to a DeviceNet network. The FDN20 station is designed to easily upgrade existing equipment to a DeviceNet network.

Specifications

TURCK FDN20 stations are designed to be mounted in standard equipment enclosures (operator stations, motor control centers, etc.). Most FDN20 stations use only screw terminal connections for all I/O and network wiring. FDN20-4S-4XSG-E has a DeviceNet ***eurofast*** ® (M12) connector on the back of the housing that enables mounting the station to an enclosure wall with the (DeviceNet) connection on the outside of the box; greatly simplifying network wiring. Detailed environmental specifications are as follows:

- Housing material: Glass filled nylon
- Protection level: IP 20
- Operating temperature: -40 to +70°C (-40 to +158°F)

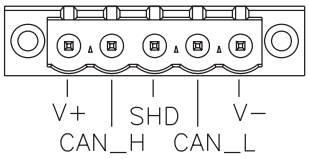
The station's components are identified in the figure below.



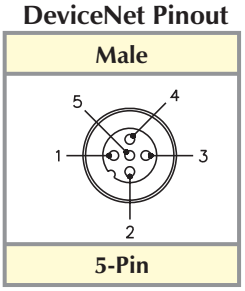
Connectors

Bus connectors:

FDN20 screw terminal and ***eurofast*** bus connectors pinouts:



1 = Shield
2 = V+
3 = V-
4 = CAN_H
5 = CAN_L



I/O connectors:

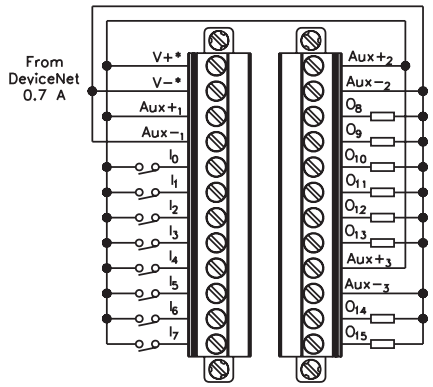
Each FDN20 version uses a different screw terminal connector. Detailed pinout information is given in the product information on the following pages.

Power

The short FDN20 stations provide all the power to the I/O devices from the DeviceNet™ power supply. In this case there is no auxiliary power connection.

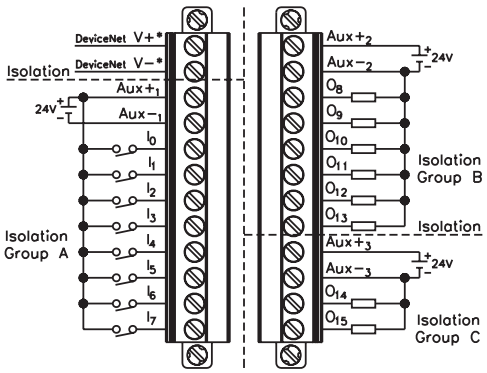
The remaining long FDN20 stations (FDN20-16XSG, for example) provide an auxiliary power connection. I/O devices can be powered from the DeviceNet or auxiliary power supply, depending on how the user chooses to wire the station. The different wiring options are illustrated in the following diagram.

*WARNING NOTE: (V+) and (V−) PROVIDE POWER FROM DeviceNet . DO NOT CONNECT TO SUPPLY OR GROUND.



CONNECT AS SHOWN TO USE DeviceNet to POWER I/O

*WARNING NOTE: (V+) and (V−) PROVIDE POWER FROM DeviceNet. DO NOT CONNECT TO SUPPLY OR GROUND.



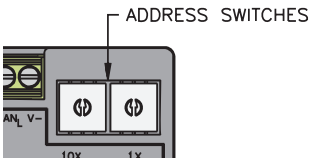
TO USE EXTERNAL POWER SUPPLY

Power ratings for FDN20 stations:

- Bus (DeviceNet) Voltage: 11-26 VDC
- Aux Power Voltage: 24 VDC (nominal)
- Internal Current Consumption: <75 mA (@ nominal 24 VDC) plus sum of I/O currents if auxiliary power is not used
- Input Voltage: 13-26 VDC (From DeviceNet supply)
- Input Short-Circuit Current: <700 mA (total for entire station)
- Input Signal Current (each input): OFF <2 mA; ON 3.0-3.4 mA (@ nominal 24 VDC)
- Input Delay: 2.5 ms
- Output Current: 0.5 A max per output

Addressing

DeviceNet stations must have a network address for communication. The address for FDN20 stations may be set via the visible rotary switches on the front of the station.



Address = 6x10 + 3x1 = 63

The pair of switches represents the address as a decimal number; the left switch being the 10's multiplier and the right switch the 1's multiplier. To program the stations, rotate the switches with a small slotted screwdriver until the arrows are pointing at the appropriate numbers for the chosen address.

Diagnostics

FDN20 stations provide a single Network Status LED for diagnosing communication problems.

- Green: Connection established
- Flashing green: Waiting for connection
- Flashing red: Connection timed out
- Red: Cannot connect
- Flashing Amber: Finding baud rate (autobaud setting)

The long housing stations (i.e. FDN20-16XSG) have an additional LED for each I/O point on the station indicating:

- Off: Point is off
- Green: Point is on

Additionally, most FDN20 stations provide diagnostic bits in the I/O table for diagnostics. One bit indicates a short-circuit fault for outputs or inputs. See product pages in this catalog for detailed I/O information.

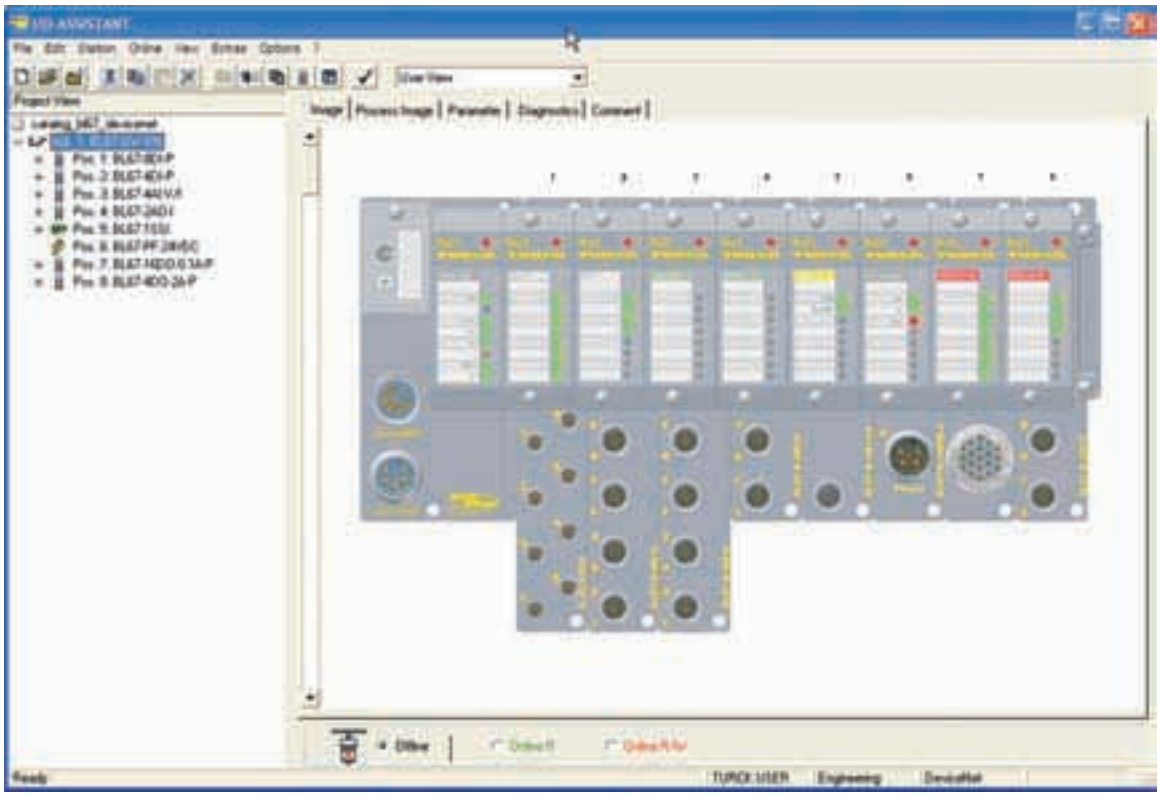
DeviceNet™ BL67 Stations

TURCK's BL67 is a modular, user configurable network I/O system designed to allow installation of nodes containing different types and sizes of I/O depending on the users needs for a particular area. Featuring IP 67 protection and metal threaded connectors, the BL67 can often be mounted in the physical process environment or directly on a machine without the need to plan or purchase a separate enclosure for the I/O. This saves planning and installation time, as well as the cost of the enclosure itself.

The BL67 system supports several different network protocols, including DeviceNet. A BL67 station consists of a gateway module that interfaces to the DeviceNet system, and several I/O modules that interface with the physical I/O in the field. Different connector options are available to allow a greater level of customization to the user.

For more details on the BL67 system please see the section G of this catalog.



TURCK's I/O Assistant software package is used to configure the BL67 system.

BL67 Gateway

BL67-GW-DN

- **Modular I/O**
- **Fieldbus Independent Configuration**
- **IP 67 Protection**
- **Various I/O Styles**

Electrical

- Operating Current: <600 mA from V_{MB}
- Supply Current: <8 A to I/O (from DeviceNet)
- Backplane Current: <1.5 A (from DeviceNet)

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 67
- Vibration: 5 g @ 10-500 Hz

Material

- Housing: PC-V0 (Lexan)

Diagnostics (Logical)

- Diagnostic information available through the DeviceNet I/O map

Diagnostics (Physical)

- LEDs to indicate status of DeviceNet and Module Bus communication

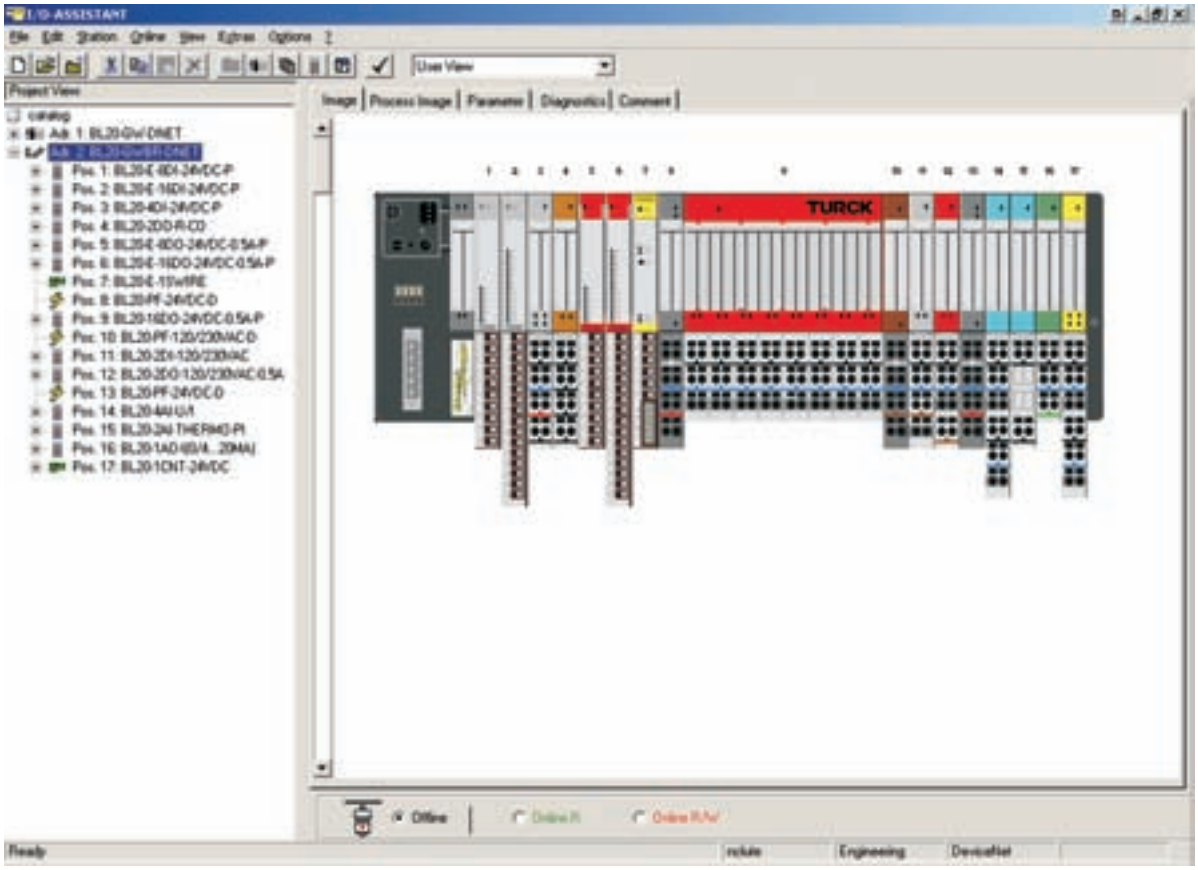
Note: Power feeding modules may be used for I/O current supply to prevent overloading the DeviceNet power supply.

DeviceNet™ BL20 Stations

TURCK's BL20 is a modular, user configurable network I/O system designed to allow installation of nodes containing different types and sizes of I/O depending on the users needs for a particular area. Featuring IP 20 protection and terminal point connections, the BL20 is intended to be mounted in the control cabinet or in a field enclosure.

The BL20 system supports several different network protocols, including DeviceNet. A BL20 station consists of a gateway module that interfaces to the DeviceNet system, and several I/O modules that interface with the physical I/O in the field. The terminal bases are available with tension clamp or screw terminal connector types.

For more details on the BL20 system please see section H of this catalog.



TURCK's I/O Assistant software package is used to configure the BL20 system.

BL20 Gateway

BL20-GWBR-DNET

- **Modular I/O**
- **Fieldbus Independent Configuration**
- **IP 20 Protection**
- **Various I/O Styles**

Electrical

- Operating Current: <250 mA from BR power supply
- Supply Current: <10 A to I/O (from U_L)
  <1.5 A to backplane (from U_{SYS})

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20
- Vibration: 1 g @ 5...100 Hz

Material

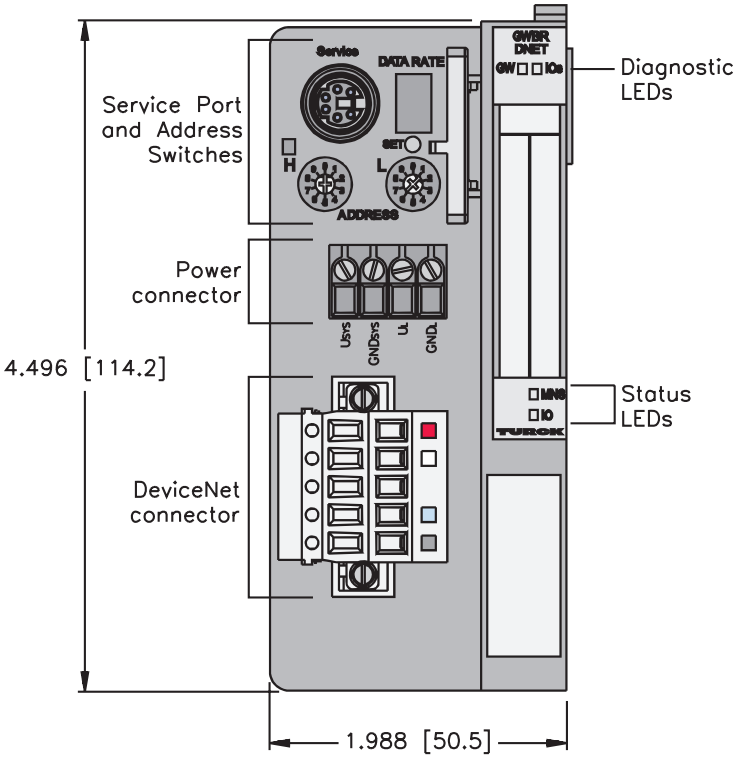
- Housing: PC-V0 (Lexan)

Diagnostics (Logical)

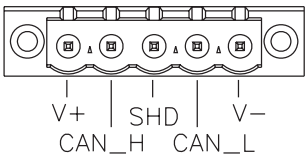
- Diagnostic information available through the DeviceNet I/O map

Diagnostics (Physical)

- LEDs to indicate status of DeviceNet and Module Bus communication



DeviceNet Connector



Power Connector

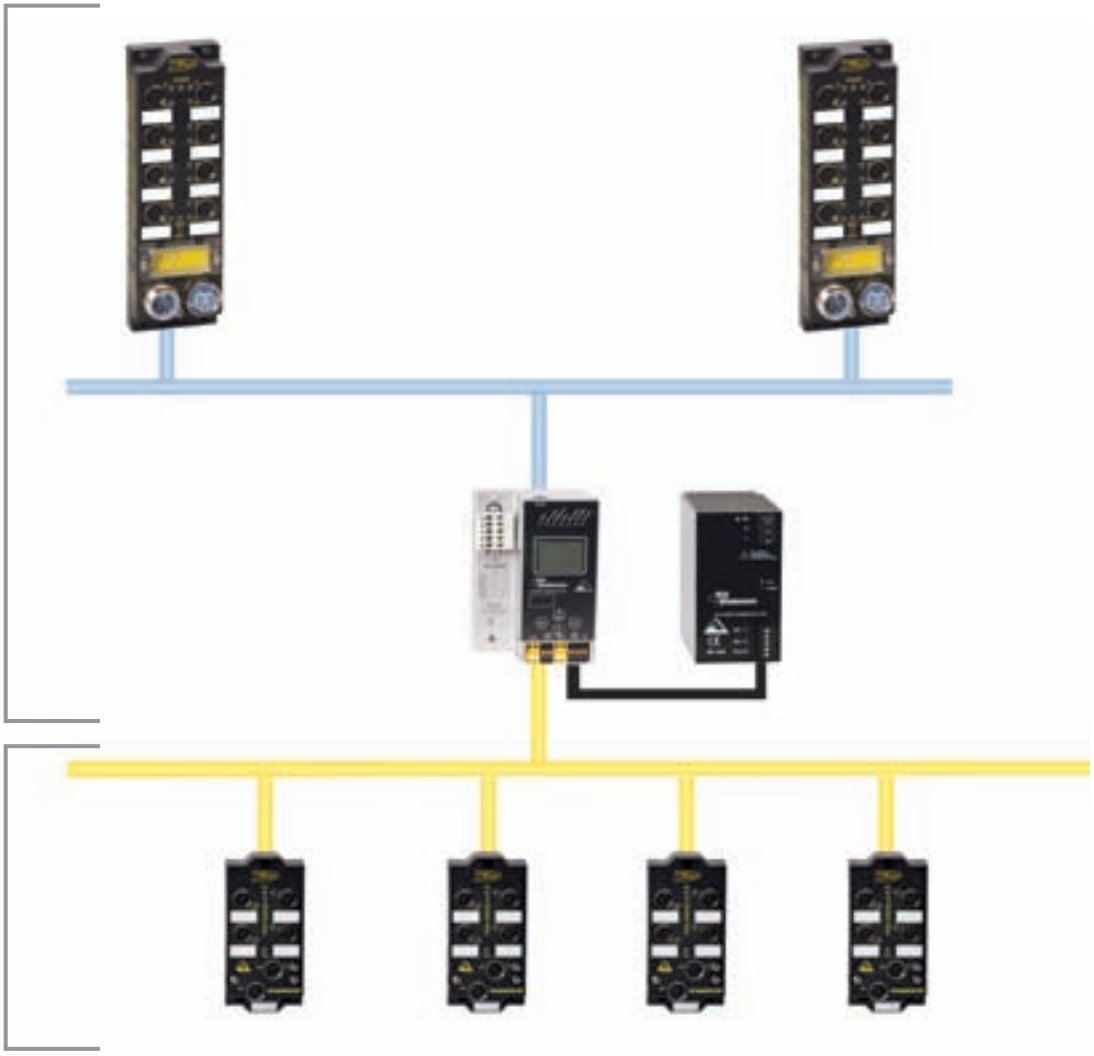
DeviceNet to AS-interface® Gateways

AS-I systems can be easily connected to a higher-level network, such as DeviceNet, through a gateway master. The gateway acts as a master to the AS-I system(s) and a slave to the DeviceNet system, mapping all of the AS-I data for DeviceNet in a single block.

For AS-I specifications and ratings details, see section E of this catalog.

DeviceNet System
(Gateway is the Slave)



AS-I System
(Gateway is the Master)

Addressing

DeviceNet™ stations must have a network address for communication. The address for AS-i/DeviceNet gateway stations may be set via the display screen and push buttons. Please consult the manual for a particular gateway for instruction on the procedure.

Diagnostics

AS-i/DeviceNet gateways contain LEDs for diagnosing I/O and communication problems for both the DeviceNet and AS-I interfaces. For a detailed description of the LED states, please see the Bihl+Wiedemann AS-i/DeviceNet Gateway User Manual available to download from www.bihl-wiedemann.com.

Power

Most AS-i/DeviceNet gateways draw power from the AS-I power supply. The option to use a separate, non-AS-I power supply is also available. Refer to the AS-I masters section of this catalog for more details on the power supply configurations.

AS-I Gateways in Stainless Steel

ASI-DNG-SS-C1D2 BW1826

* Not ETL Listed

- **AS-I v3.0 Supported**
- **Graphical Display**
- **Integrated Ground-Fault Detection**
- **Integrated AS-I Diagnostics**

Electrical

- Operating Current: 200 mA from V_{AS-I} (Power Supply A)
  200 mA from V_{AS-i1}, 70mA from V_{AS-i2} (Power Supply A2)
  250 mA from V_{AUX} (Power Supply E)

Power Distribution

- From AS-I supply for each network (Power Supply A, A2)
- From external supply (Power Supply E)

Mechanical

- Operating Temperature: 0 to +55°C (+32 to +131°F)
- Protection: IP 20
- Vibration: According to EN 61131-2

Material

- Housing: Stainless Steel

Diagnostics (Logical)

- AS-I diagnostic data is available via Network interface

Diagnostics (Physical)

- LEDs to indicate status of network and AS-I communication and power supply

Notes:

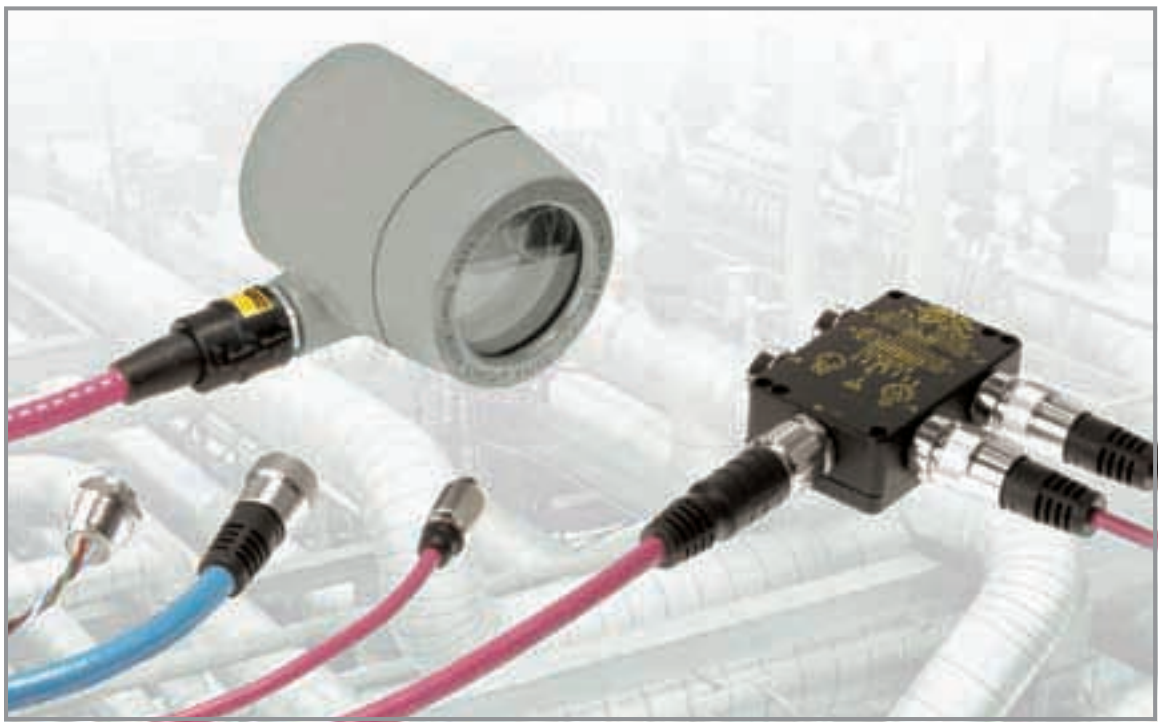
PROCESS WIRING

TURCK Process Wiring Solutions

This catalog contains products from **TURCK's** extensive line of industrial wiring products that are optimized for process applications. The receptacles, drop cords, junction boxes, home-run cables and accessories described within, comprise a process wiring system designed for the demanding conditions of process applications.

- Quick-disconnect design eliminates mis-wiring and speeds installation.
- Instrument receptacles, drop cords, junction boxes and home-run cordsets reduce multiple cable runs.
- Shielded-twisted pair construction serves analog and HART applications.
- Cables with premium PVC insulation provide superior chemical resistance and flexibility.
- Choice of stainless steel or nickel-plated brass hardware.
- Rated and approved for installation in process applications.
- Many products are FM approved for installations in hazardous locations.



2-Wire Analog or HART Control Circuits

Additional Analog or Discrete Control Circuits

Code Requirements for Flexible Process Wiring Products
Ordinary (Nonhazardous) Locations

Figure 1

Type ITC cable, or Instrumentation Tray Cable, provides a cost effective alternative for installation of low power instrumentation and control circuits. The National Electrical Code's (NEC) Article 727 permits the use of ITC- rated cables "in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation". It may be used in "instrumentation and control circuits operating at 150 volts or less and 5 amps or less." Permitted uses include installation in cable trays or basket trays (Figure 1), or as Exposed Run wiring in specified circumstances.

One of the permitted uses as of ITC cable is illustrated in Figure 2. NEC, Article 727.4(5) allows ITC cable without metallic sheath or armor between cable tray and equipment in lengths not to exceed 15 m (50 ft.), where the cable is supported and protected against physical damage using mechanical protection, such as struts, angles, or channels.

Figure 2

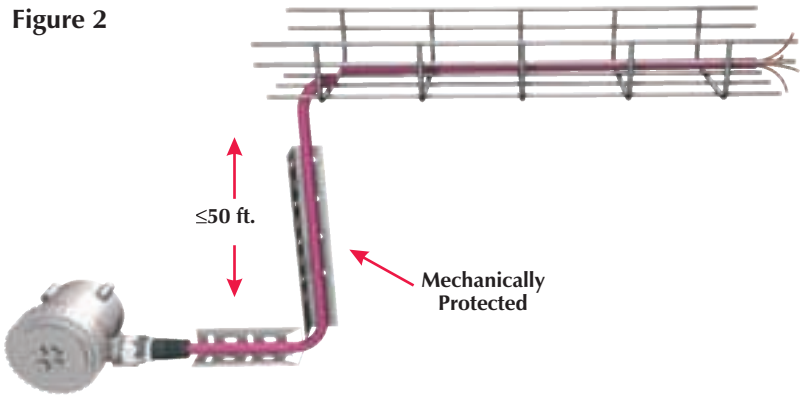


Figure 3

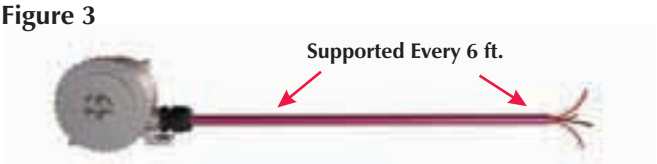

Another permitted use of ITC cable that increases flexibility is illustrated in Figure 3. NEC Article 727.4 (4) allows ITC cable to be used where enclosed in a smooth metallic sheath, continuous corrugated metallic sheath, or interlocking tape armor applied over the nonmetallic sheath in accordance with 727.6. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft.)."

When using armored cable, there is no requirement for further mechanical protection or a length limitation. When using ITC cable that complies with the requirements of NEC 727.4(6) no further protection is required.

Code Requirements for Flexible Process Wiring Products
Ordinary (Nonhazardous) Locations

NEC 727.4(6) allows the installation of ITC cable that complies with the crush and impact of Type MC cable between the cable tray and equipment in lengths not to exceed 15 m (50 ft.) without additional protection. Cable meeting this requirement is identified as "Exposed Run" or "ER" (Figure 1).

This concept enables convenient wiring methods, given that drops from a cable tray may be made without additional auxiliary trays or raceways. Additionally, ITC cable uses 300 volt insulation, resulting in smaller diameter, more flexible cable, with no requirement for special (e.g. Class 2) power supplies. When the ITC cable concept is combined with the **TURCK** process wiring system, the result is an extremely flexible and cost-effective system for process wiring. The basic building blocks of the system are device receptacles, junction boxes, and molded cordsets.

Figure 1

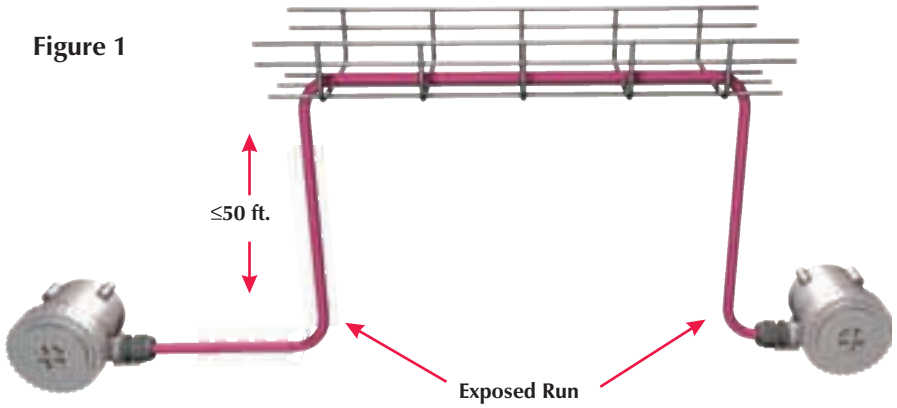

Figure 2

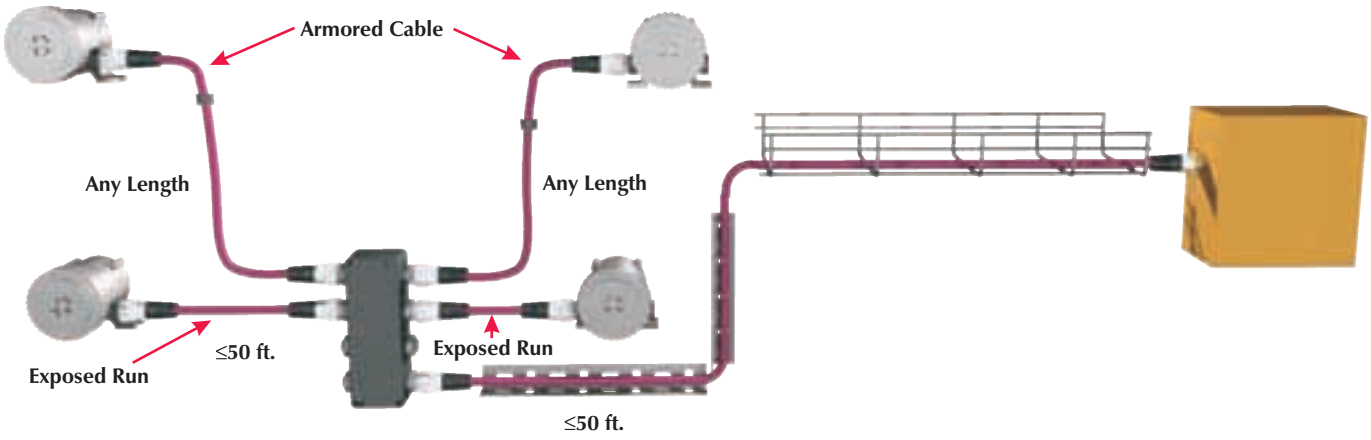


TURCK
Process Wiring Products

The **TURCK** process wiring system provides an integrated, code-compliant wiring method that adds the benefits of quick-disconnects to the ITC cable installation concepts.

Receptacles with 1/2-14NPT and 3/4-14NPT threads, as well as M20x1.5, easily extend the benefits of quick-disconnect wiring to most process instruments.

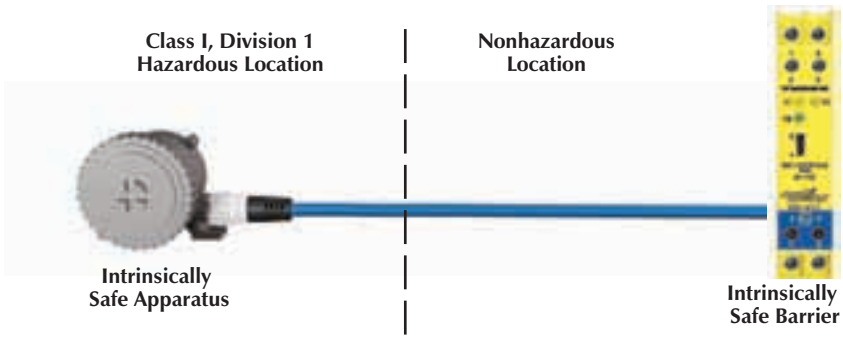
Junction boxes can significantly consolidate field wiring. They are available in metal or nylon housings with 4 or 8 ports and home-run quick-disconnects or integral home-run cables.

Molded quick-disconnect cordsets, using ITC cable, provide the ratings and performance characteristics required for process applications.

Hazardous Locations

Even more value can be derived from the **TURCK** process wiring system in hazardous locations. The system is now FM approved for use in Class I, Divisions 1 and 2 when installed per **TURCK** drawing QCF-00147 and CSA certified when installed per **TURCK** control drawing Ni-2.404. Contact **TURCK** for a copy of the approval documents or visit www.turck.com/fmcd.

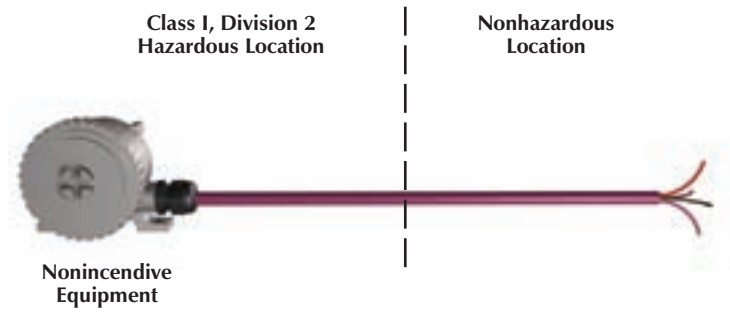
Intrinsically Safe Circuits



Intrinsically safe circuits may be wired using any of the wiring methods suitable for unclassified locations. The use of connectors is allowed as intrinsically safe circuits are safe against faults, including opening, shorting or grounding.

The same requirements for mechanical protection and length limitations apply as in nonhazardous locations.

Nonincendive Equipment*



FM:

ITC cable is a recognized Division 2 wiring method. NEC in Article 501.10 (B)(1)(5) states "Type ITC cable as permitted in 727.4". This is further reinforced by Article 727.4 (3), which states that ITC cable is permitted "in hazardous locations as permitted in 501.10,...".

The same requirements for mechanical protection and length limitations apply as in nonhazardous locations.

CSA:

Canadian installations require the use of specific cable types for non-intrinsically safe circuits in Class I, Division 2 areas. **TURCK** offers CMX-HL cables for unprotected cable runs and CIC cable (Control and Instrumentation Cable) for cable runs in cable trays.

Quick-disconnects that do not require a tool to disengage are considered “normally arcing”. They are not allowed to be used in Division 2 for incendive circuits without additional protection.

lokfast™ guards enable the use of quick-disconnect technology in Class I, Division 2 hazardous locations. ***lokfast*** guards render quick-disconnects not “normally arcing” by:

- Eliminating access to the coupling nut making disconnection impossible.
- Warning the user to disconnect power before removing.
- Requiring a tool for removal.

lokfast guards are available for 7/8-16UN ***minifast***® and M12 ***eurofast***® molded and field-wireable connectors.

Optional M23 ***multifast***® home-run connectors with set screw locks also render a connection not “normally arcing”.

lokfast guards (or integrally locked ***multifast*** connectors) on all quick disconnects in Division 2 (Figure 1).

The molded construction of the home-run connector and the gas/vapor tight continuous sheath meet the NEC Article 501-15(E)(2) requirements for cable seals in Division 2.

The same requirements for mechanical protection and length limitations apply as in to nonhazardous locations.

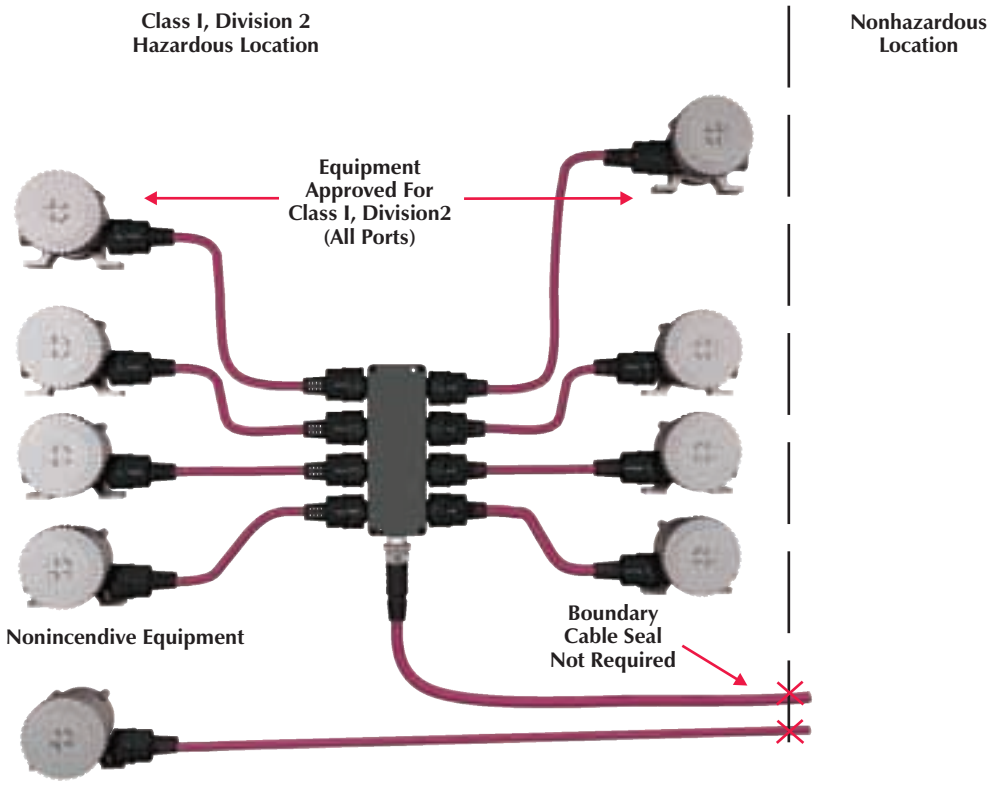


Figure 1

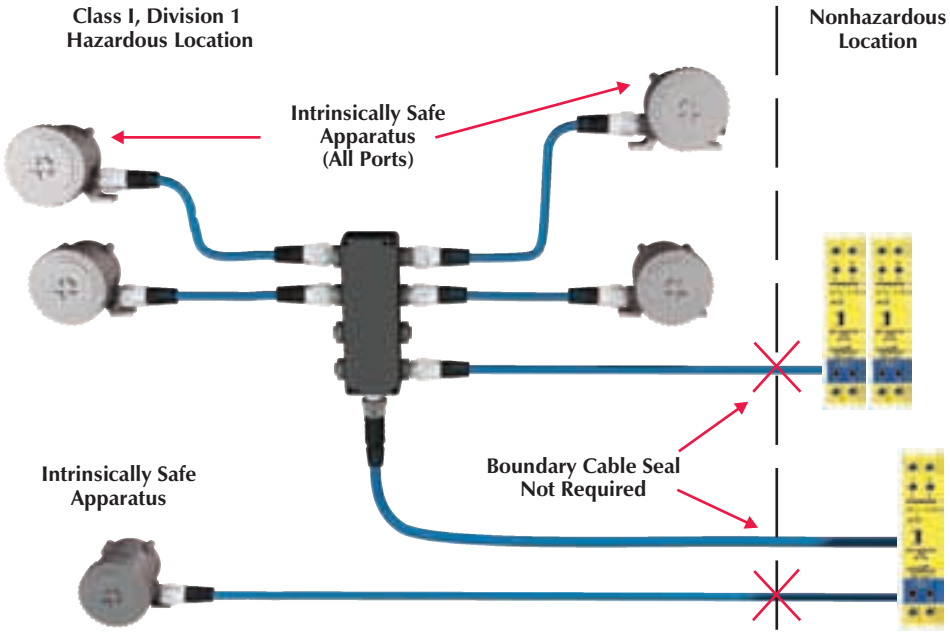
Intrinsic Safety Summary

Intrinsically safe circuits do not require additional protection for quick-disconnects.

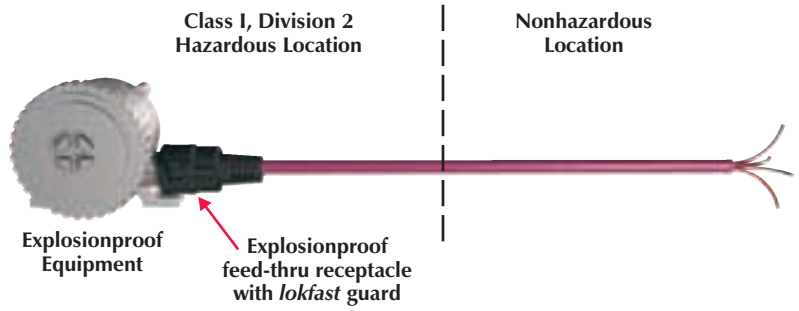
Junction boxes must have FM-approved spacings and entity parameters for intrinsically safe circuits.

Boundary seals are not required for this location, as the molded home-run connecter and the gas/vapor tight continuous cable sheath meet the NEC Article 501-15©) requirements for cable seals in Class I, Divisions 1 and 2.

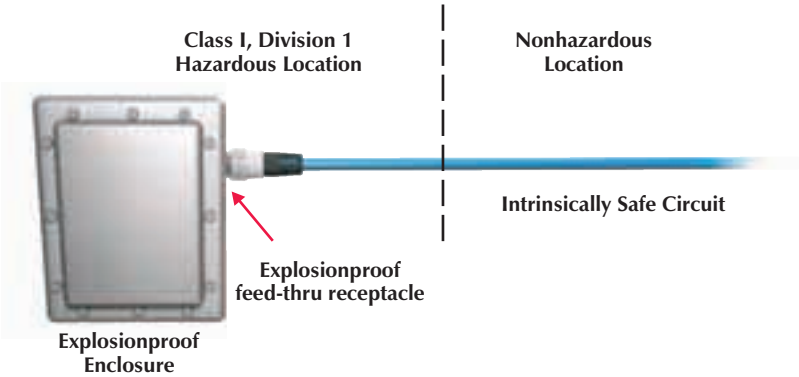
Requirements for mechanical protection and length limitations are equivalent to nonhazardous locations.



Explosionproof Equipment



ITC cable, a recognized Division 2 wiring method, may be used to connect Explosionproof equipment installed in Division 2 when used with an explosionproof feed-through receptacle. The extremely robust receptacle maintains the equipment's explosion containment protection scheme. The external wiring, however, is in Division 2, and can therefore be installed using Division 2 wiring methods.



Explosionproof feed-thru receptacles may also be used to feed intrinsically safe circuits into or out of explosionproof enclosures in Class I, Division 1 hazardous locations.

Specifications

Housing:	Glass filled nylon.	
Connectors	Nickel plated brass or 316 stainless steel housings (see table), Nylon contact carriers.	
Temperature:	-30° to +80°C (-22° to +176°F).	
Contacts:	Gold plated brass.	
Protection:	IP 68.	
Cable:	Standard Version:	Plum PVC jacket, UL ITC/PLTC/AWM, CSA CMX-Outdoor/CMG/AWM FT4, 300 V, 105°C.
	"/C" Versions:	Plum PUR jacket, UL ITC/PLTC, CSA CIC/CMX-Outdoor-CM, 300 V, 105°C, FT1.
Electrical Rating:	Standard Version:	100 V, 4 A per conductor (use as ITC is limited to 3 A for 22 AWG conductors).

Specifications

Housing: 316 stainless steel (SS), passivated.
Contact Carrier: PUR black.
Electrical Ratings: 600 V, 9 A per conductor.
Temperature: -30° to +105°C (-22° to +221°F).
Contacts: Gold plated brass.
Protection: IP 67 (only when all receptacles are mated or covered with plugs).
Leads: High flex stranding, PVC, insulated, 600 V, UL recognized, CSA certified.

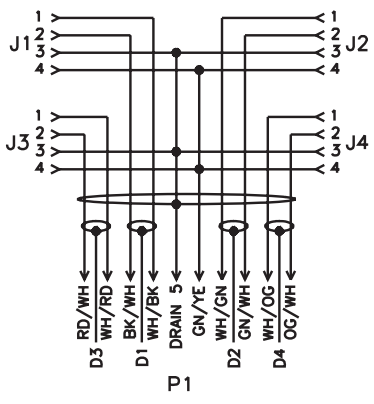
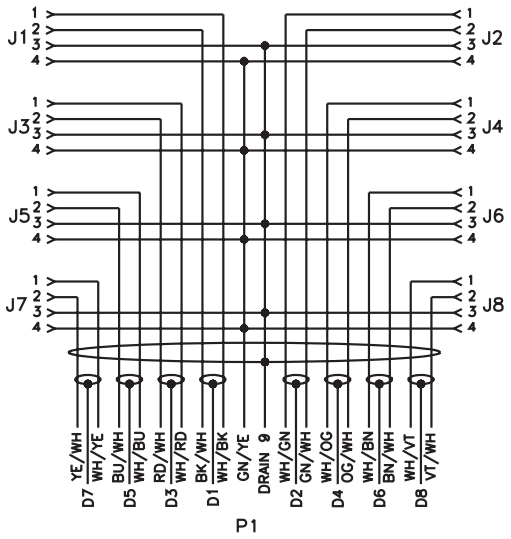
Wiring Diagrams

4-Port



8-Port



Specifications

Housing:	Die-cast aluminum alloy.
Connectors	Nickel plated brass or 316 stainless steel housings (see table), oil resistant PUR contact carrier.
Temperature:	-30° to +80°C (-22° to +176°F).
Contacts:	Gold plated brass.
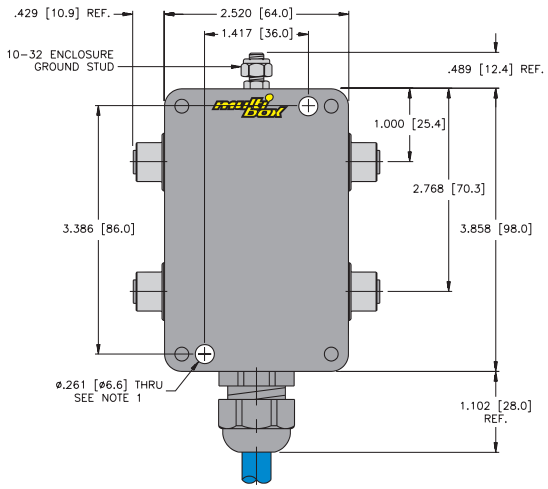
Protection:	IP 68.
Cable:	Blue PVC jacket, UL ITC/PLTC/AWM, CSA CMX-Outdoor/CMG/AWM FT4, 300 V, 105°C.
Electrical Rating:	Standard Version: 250 V, 4 A per conductor (use as ITC is limited to 150 V, 3 A for 22 AWG conductors). "/C" Versions: 30 V, 600 mA

Dimensions

4-Port



8-Port

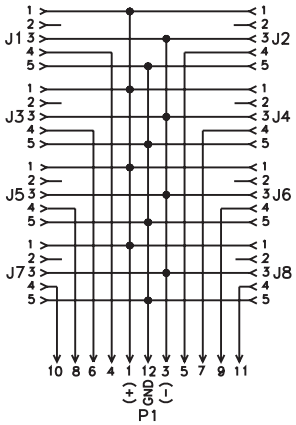
** Use with ***lokfast*** LOCK-EURO-G for port connectors in Class I, Division 2 applications and for mating Home-Run cable use "L" and "T" versions
See page K173 for mating home run cable.

Wiring Diagram

8-Port Diagram, 1 Discrete Signal Per Port

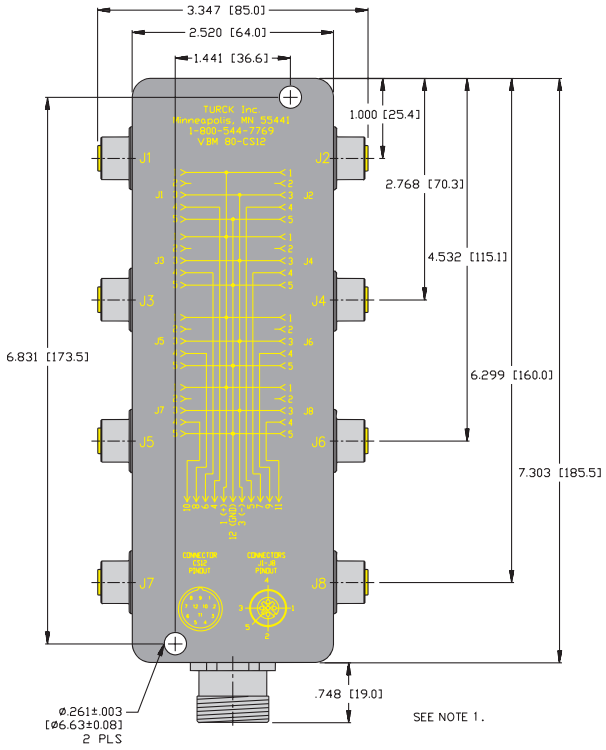


Specifications

Housing:	Die-cast aluminum alloy.
Connectors	Nickel plated brass or 316 stainless steel housings (see table), oil resistant PUR contact carrier.
Temperature:	-30° to +80°C (-22° to +176°F).
Contacts:	Gold plated brass.
Protection:	IP 67.
Electrical Rating:	Standard Version: 150 V, 4 A per conductor.
	"/C" Versions: 30 V, 600 mA

Dimensions

4-Port



Notes:
1. Clearance hole for 1/4-20 mounting screws (2 not included).

Pinouts

Specifications

Housing: 316 stainless steel (SS), passivated.
Contact Carrier: PUR black.
Electrical Ratings: 600 V, 9 A per conductor.
Temperature: -30° to +105°C (-22° to +221°F).
Contacts: Gold plated brass.
Protection: IP 67 (only when all receptacles are mated or covered with plugs).
Leads: High flex stranding, PVC, insulated, 600 V, UL recognized, CSA certified.

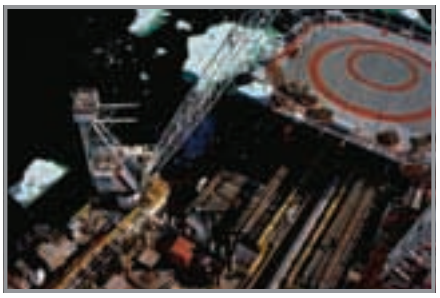
Cables and Cordsets for Extreme Applications

TURCK *extremelife* connectors are approved by DNV and ABS for use in marine shipboard environments. **TURCK** also has an entire line of junction boxes for wiring consolidation. From off-the-shelf junctions for 4-20 mA transmitters, to custom boxes for any application, **TURCK** reduces costs by making wiring faster, easier and more reliable.

- ABS Approved
- Certified petr IEEE-45
- UL listed for Marine Applications to STD UL 1309
- Meets IEC 332-3 Category A Flame Test
- CSA listed to C22.2 No. 245
- Jacket Material Provides Impact Protection to -50°C (-58°F)
- Available in Multiple Configurations

extremelife ® cables are heavy duty for extreme temperature environments and provide excellent resistance to extreme cold temperatures and oilfield drilling muds. **TURCK** offers multiple single and twisted pair conductor options. ***extremelife*** cables are available in two jacket types, ***extremelife-25*** and ***extremelife-55***.
The following characteristics are specific to each cable.

Characteristics	*extremelife-25*	*extremelife-55*
Cable Gage Range	16 to 22	
UL Rating	UL1309	
CSA Rating	CSA 22.2 No. 245	
ABS Approval No.	03-HS400763-PDA	
IEEE Approvals	IEEE 45-1998 and IEEE 1580-2001	
Flexible Stranding	Yes	
Standard Insulation	T75 and T90 UL and CSA, T75 IEEE	
XLPE Insulation	110X for increased electrical properties required for network applications	
Flame Retardancy	IEEE 1202/FT4 and IEC 332-3 Category A	
Cold Bend Pass Temperature	-40°C (-40°F)	-55°C (-67°F)
Cold Impact Pass Temperature	Good	-50°C (-58°F)
Cut through and Abrasion Resistance	Good	Excellent
Moisture and Oil Resistance	Excellent	
Installation Handling	Good	
Oilfield Drilling Mud Resistance	Excellent	
Braided Armor	Available with or without	
Sunlight Resistance	Yes	

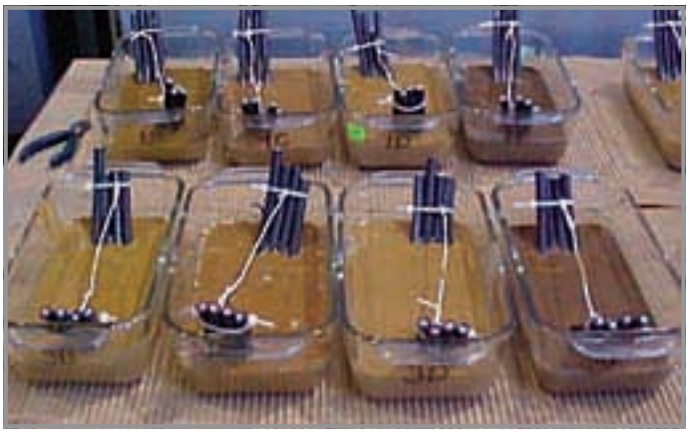


extremelife ® cables have been extensively tested in various drilling muds/fluids. Samples of five different drilling fluids were used to evaluate how ***extremelife*** cables handle harsh environments. Cable samples were placed in the muds and put in a test oven at +65.6°C (+150°F). Shrink/swell and tensile strength/elongation were monitored throughout a 28 day aging test.

The ***extremelife*** cables, with their exclusive jacket materials, were compared with the industry standard neoprene cables. All tested cables passed the tensile strength and elongation tests. The ***extremelife*** cables proved to be much more stable in size through the tests when compared to the neoprene jacketed cables.

Drilling Mud Types Used:

- Water based
- Synthetic based (two types)
- Diesel based
- Mineral oil based



extremelife Cables:

- Standard cables are stocked for quick delivery, and custom designs ship within 6 to 10 weeks.
- Multiple designs and custom configurations can be built using 16 to 22 AWG wires.
- Bronze armor styles combined with stable tinned-copper armor.
- Cost effective cables, since ***extremelife*** can be made with 22 AWG conductors and tinned-copper armor.
- Assorted conductor sizes and insulation materials allow usage in network applications.

minifast® lokfast® Guards

Part Number	Application
LOCK-MINI	*Nylon locking guard for straight minifast standard body connectors (RKM, RKV, RSM and RSV) in Class I, Division 2 installations**
LOCK-MINI (10/BAG)	
LOCK-MINI-ANGLE	*Nylon locking guard for right angle minifast standard body connectors (WKM, WKV, WSM and WSV) in Class I, Division 2 installations**
LOCK-MINI-ANGLE (10/BAG)	
LOCK-MINI-FW	*Nylon locking guard for straight minifast field wireable connectors (BS 41..., and B 41...) in Class I, Division 2 installations**
LOCK-MINI-FW (10/BAG)	
LOCK-MINI-B&C	*Nylon locking guard for straight minifast "B" Style and "C" Style connectors (RKM, RKV, RSM and RSV) in Class I, Division 2 installations**
LOCK-MINI-B&C (10/BAG)	
LOCK-MINI-B&C-ANGLE	*Nylon locking guard for right angle minifast "B" Style and "C" Style connectors (WKM, WKV, WSM and WSV) in Class I, Division 2 installations**
LOCK-MINI-B&C-ANGLE (10/BAG)	

***lokfast* Closed**

***lokfast* Open**

eurofast® lokfast Guards

Part Number	Application
LOCK-EURO-G	*Nylon locking guard for straight eurofast G-body connectors (RKG, RKGV, RSG and RSGV) in Class I, Division 2 installations**
LOCK-EURO-G (10/BAG)	
LOCK-EURO-R	*Nylon locking guard for straight eurofast R-body connectors (RKR, RKRV, RSR and RSRV) in Class I, Division 2 installations**
LOCK-EURO-R (10/BAG)	
LOCK-EURO-FW	*Nylon locking guard for straight eurofast field wireable connectors (B81.., BS81.. and BM81..) in Class I, Division 2 installations**
LOCK-EURO-FW (10/BAG)	

***lokfast* Open**

***lokfast* Closed**

* See **TURCK** Control Drawing QCF-00147 (FM) or Ni-2.404 (CSA) at www.turck.com/fmcd/ for guidance on installation in hazardous locations.

lokfast® Guards for use with AIM Stations

Part Number	Application
LOCK-FP-T	*Nylon locking guard kit for use with models FDNP-L0808G-TT, FDNP-XSG16-TT in Class I, Division 2 installations**
LOCK-FL-T	*Nylon locking guard kit for use with models FDNL-L1600-T, FDNL-CPG88-TT in Class I, Division 2 installations**
LOCK-FQ-T	*Nylon locking guard kit for use with models FDNQ-XSG08-T, FDNQ-S0800-T in Class I, Division 2 installations**
LOCK-4MB12	*Nylon locking guard kit for use with models 4MB12-4P2-CS12, 4MB12-5P3-5 in Class I, Division 2 installations**
LOCK-8MB12	*Nylon locking guard kit for use with models 8MB12-4P2-CS12, 8MB12-5P3-5 in Class I, Division 2 installations**
LOCK-FP-E	*Nylon locking guard kit for use with model FENP-XSG16 in Class I, Division 2 installations**
LOCK-FP-C	*Nylon locking guard kit for use with model FLDP-IOM 88-0001 in Class I, Division 2 installations**
LOCK-FL-E	*Nylon locking guard kit for use with model FDNL-S1600-E in Class I, Division 2 installations**
LOCK-FL-C	*Nylon locking guard kit for use with model FDNL-L1600-C in Class I, Division 2 installations**
LOCK-FQ-E	*Nylon locking guard kit for use with model FDNQ-CSG44-E in Class I, Division 2 installations**
LOCK-FQ-C	*Nylon locking guard kit for use with model FDNQ-S0400-C in Class I, Division 2 installations**
LOCK-FP-REP	*Nylon locking guard kit for use with models FDN-DN1, REP-DN, FDN-MSTR in Class I, Division 2 installations**

Guards for *lokfast* Bus Ports

Guards for *lokfast* Aux Power Ports

Guards for *lokfast* I/O Ports

* ***lokfast*** kit includes guards for Bus / I/O / Aux Power depending on module kits.

minifast® Conduit Adapters, 1 Port

- **Attaches to Standard Crouse-Hinds 3/4" Form 8, Mark 9 Conduit Bodies for Transition to 3 and 5-Wire *minifast* Connectors**
- **Gasket and 8-32 x 1/2 Mounting Screws**
- **IP 67 Protection (only when all receptacles are mated or covered with plugs)**
- **Terminal Strips Accept Up to 12 AWG Wires**

Drawing	Part Number	Specs	Application	Wiring Diagrams
	CA-1/RKF 30	Nylon Housing 80°C 250 V, 9 A	*Attaches to standard conduit body for transition to 3-wire minifast connector*		CA-1/RKF 40		*Attaches to standard conduit body for transition to 4-wire minifast connector*		CA-1/RKF 50		*Attaches to standard conduit body for transition to 5-wire minifast connector*	
Standard receptacle housing material is nickel plated brass.."RKF"; "RKFV" indicates 316 stainless steel.
Example: CA-1/RKFV 50.

Pinouts

		3-Pin	**4-Pin**	**5-Pin**

minifast® Conduit Adapters, 2 Port

- **Attaches to Standard Crouse-Hinds 3/4" Form 8, Mark 9 Conduit Bodies for Transition to 3-5 Wire *minifast* Connectors**
- **Gasket and 8-32 x 1/2 Mounting Screws**
- **IP 67 Protection (only when all receptacles are mated or covered with plugs)**
- **Terminal Strips Accept Up to 12 AWG Wires**

Drawing	Part Number	Specs	Application	Wiring Diagrams
	CA-2/RKF 30	Nylon Housing 80°C 250 V, 9 A	*Attaches to standard conduit body for transition to 3-wire minifast connector.*		CA-2/RKF 30/S651		*Attaches to standard conduit body for transition to 3-wire minifast connector, parallel wired.*		CA-2/RKF 40		*Attaches to standard conduit body for transition to 4-wire minifast connector.*		CA-2/RKF 40/S651		*Attaches to standard conduit body for transition to 4-wire minifast connector, parallel wired.*		CA-2/RKF 50		*Attaches to standard conduit body for transition to 5-wire minifast connector.*		CA-2/RKF 50/S651		*Attaches to standard conduit body for transition to 5-wire minifast connector, parallel wired.*	
Standard receptacle housing material is nickel plated brass.."RKF"; "RKFV" indicates 316 stainless steel.
Example: CA-2/RKFV 50.
For pinouts see bottom of page K222.

eurofast® Conduit Adapters

- **Attaches to Standard Crouse-Hinds 3/4" Form 8 Conduit Bodies for Transition to 5-Wire *eurofast*® Connectors**
- **Gasket and 8-32 x 1/2 Mounting Screws Included**
- **IP 67 Protection (only when all receptacles are mated or covered with plugs)**
- **Terminal Strips Accept Up to 12 AWG Wires**

Drawing	Part Number	Specs	Application	Pinout	Wiring Diagrams
	CA-1/FK 4.5	Nylon housing 80°C 250 V, 4 A	*Attaches to standard conduit body for transition to 5-wire eurofast connector*			CA-2/FK 4.5				
Standard receptacle housing material is nickel plated brass "CA-1(2)/FK 4.5"; "CA-1(2)/FKV 4.5" indicates stainless steel.

multifast® Conduit Adapters, 1 Port

- Attaches to Standard Crouse-Hinds 3/4" Form 8, Mark 9 Conduit Bodies for Transition to 12 and 19-Pin *multifast* Connectors
- Gasket and 8-32 x 1/2 Mounting Screws Included
- IP 67 Protection (only when all receptacles are mated or covered with plugs)
- Terminal Strips Accept Up to 14 AWG Wires

Drawing	Part Number	Specs	Application	Wiring Diagrams
	CA-1/CK 12	Nylon housing Nickel plated brass receptacle housing 80°C 300 V, 4 A	*Attaches to standard conduit body for transition to 12-pin multifast connector.*		CA-1/CKV 12	Nylon housing Stainless steel receptacle housing 80°C 300 V, 4 A		
	CA-1/CK 19	Nylon housing Nickel plated brass receptacle housing 80°C 150 V, 4 A	*Attaches to standard conduit body for transition to 19-pin multifast connector.*		CA-1/CKV 19	Nylon housing Stainless steel receptacle housing 80°C 150 V, 4 A

TURCK Standards

One or more of the following standards may apply to products or components of products in this catalog. This section is intended to provide a reference to the applicable standards only. Original or facsimiles of the original standards documents should be used for interpretation. It is the responsibility of the user to determine the suitability of use of the products represented in this catalog.

ANSI/B93.55M

Generally defines the geometry and connection scheme of "mini" type connectors used in fluid power (valve) applications. It defines the numerical marking of the pins and the conductor size and colors for 3 and 5 pin versions. This specification was the basis for the so-called "automotive" standard conductor colors that are widely used on sensors.

CENELEC EN 50 044

Identifies connections for inductive proximity switches. The specification defines conductor colors for proximity switches with 2, 3, or 4 conductors. It also defines numerical marking of the terminals, whether quick disconnect, or not. **TURCK** sensors and recommended cordsets that apply within the scope of the standard comply with CENELEC EN 50 044. The conventions defined in this standard have been widely adopted in industry to include photoelectric controls and other related sensing devices.

CSA

The Canadian equivalent of UL in Canada. It is a government-run organization that tests and *certifies* that products conform to their own set of safety-related specifications.

DIN 43650

Defines the geometry and other characteristics of the "square" connectors most frequently used on hydraulic and pneumatic solenoid valves and other devices in the fluid power industry.

MSHA

The Mine Safety and Health Administration - a US Government agency that ensures and regulates safety for mines and mine workers. The MSHA approval is required for products used in underground mines, including electrical equipment, power cords, and instrumentation components.
The MSHA standards require special fire-resistant properties and characteristics that prevent the propagation of flames.

NRTL

Nationally Recognized Test Laboratory - An independent laboratory authorized by the US Government to perform product safety evaluations. Test laboratories must meet government laboratory standards, and are audited annually by OSHA to maintain this credential. UL standards are adopted by the US government and OSHA as being "Safety Standards", and these accredited labs then use the UL standards to perform product evaluations.

The Canadian Standards Association, (CSA) is authorized as a NRTL to perform product evaluations and tests to the UL Standards. The certification mark "CSA NRTL/C" is then applied to products that satisfy all construction and performance criteria for both US and Canada. This certification mark is generally accepted by local building, safety, and quality agencies as meeting safety, construction, and performance criteria in both the US and Canada.

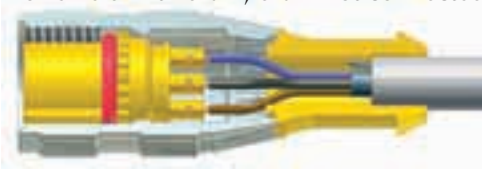
Shielded Cordsets

Whenever wire is used to transmit electrical data, it is possible for the wire to absorb external noise, possibly changing the characteristics of the electrical signal, or to give off noise that could cause changes in other electrical components that are near. Shielding is the act of placing conductive material between the potential noise emitters and receivers.

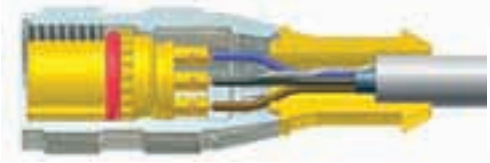
Electrical noise is usually classified as electro-magnetic interference (EMI) or radio frequency interference (RFI).

TURCK offers a number of shielding options:

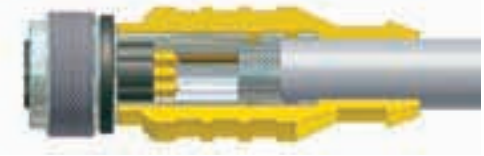
1. Foil shield with drain, drain not connected



2. Foil shield with drain, drain connected to a pin



3. Foil and braid shield with shield tied to coupling nut



4. Aluminum armored cable with armor tied to coupling nut

For a shield to be effective, it must be tied to a ground at some point. It is usually preferred to not tie the shield to ground at more than one point to avoid ground loops. A shield not tied to a ground will reflect some noise and is better than no shield at all, but will be much more effective if tied to a ground.

High frequency noise, RFI, is handled well with a foil shield. The wavelength of RFI is usually small and can pass through the 'holes' in a braided shield. EMI is usually larger wavelengths and needs a braided shield to increase the mass of shielding material to be effective.

Aluminum armored cables provide the ultimate in noise immunity as they are basically flexible conduit.

Select the shielded cordset that best meets your needs. If it is easier to tie the shield to ground inside the panel, the foil/drain with the drain not connected inside the cordset is a good choice. If you can connect the drain via a pin inside the device being connected, the foil/drain with the drain connected to a pin is a good choice. Any environments with EMI noise from things like large motors or welding equipment will benefit from a braided shield tied to the coupling nut.

TURCK shielded cordsets with the shield tied to the coupling nut offer complete shielding for the entire length of the cordset. A metal sleeve inside the molded body connects the braid/foil shield of the cable to the metal coupling nut with no loss of shielding potential.

TURCK armored cordsets are the ultimate in shielded connectors. A **TURCK** patented process allows the interlocked aluminum armor to be connected directly to the coupling nut offering the same protection as running conductors inside metal conduit.

IP Protection Class

IP		Dust Protection						
		0_ Unprotected	1_ Objects ≥50mm	2_ Objects ≥12.5mm	3_ Objects ≥2.5mm	4_ Objects ≥1.0mm	5_ Dust Protected	6_ Dust Tight

	_6K Intense Jet Water High Pressure						IP 56K	IP 66K
	_7 Temporary immersion							IP 67
	_8 Continuous immersion as specified by manufacturer							IP 68
	_9K Water at high pressure/Steam jet cleaning							IP 69K

IP 67 Protection

First ID Number	Protection from penetration of…	Requirements
0	Unprotected	N/A
1	Solid Foreign Particles Ø50 mm	No full penetration of sphere with Ø50 mm
2	Solid Foreign Particles Ø12.5 mm	No full penetration of sphere with Ø12.5 mm
3	Solid Foreign Particles Ø2.5 mm	No penetration of rod with Ø2.5 mm
4	Solid Foreign Particles Ø1.0 mm	No penetration of wire with Ø1.0 mm
5	Dust	Dust may only penetrate in such quantity that function and safety are not impacted
6	Dust	No penetration of dust

Second ID Number	Protection from penetration of…	Requirements
0	Unprotected	N/A
1	Dripping water	Vertically falling drips may not cause any damage
2	Dripping water when the enclosure is in a slanted position of up to 15°	Vertically falling drips may not cause any damage
3	Spraying water	Spraying water, which is sprayed in a perpendicular angle of up to 60° may not cause any damage
4	Splashing water	Water splashing against the enclosure from every direction may not cause any damage
4K	Splashing water with increased pressure	Water splashing against the enclosure from every direction and with increased pressure may not cause any damage
5	Jet water	Water which is hosed against the enclosure from every direction may not cause damage
6	Intense jet water	Water which is hosed against the enclosure with high intensity may not cause any damage
6K	Intense jet water with increased pressure	Water which is hosed against the enclosure with high intensity and increased pressure may not cause any damage
7	Temporary immersion in water	Water may not enter the enclosure in such quantity as to cause damage when the enclosure is held under water for a set period of time using predetermined pressure (1 m for 30 min)
8	Continuous immersion in water	Water may not enter the enclosure in such quantity as to cause damage when the enclosure is held under water for a set period of time using predetermined pressure (TURCK standard is 6’ of water, and other chemicals, for a period of 24 hours)
9K	Water at high-pressure/steam jet cleaning	Water which is directed against the enclosure from every direction with extremely high pressure may not cause any damage (14 to 16 l/min at 8,000 to 10,000 kPa)

6.2 Rod Entry Test - a ½" diameter rod may not enter the enclosure and a 1/8" rod cannot enter within 4" of live components

6.3 Drip Test - 20 drops per minute for 30 minutes with no water entering enclosure 6.3.2.2 Evaluation, no water shall enter enclosure

6.4 Rain Test - All exposed surfaces are sprayed with 5 psi of water for 60 minutes at a rate of 18" per hour rise in a straight sided pan 6.4.2.1 Evaluation, No water shall have reached live parts, insulation, or mechanisms 6.4.2.2 Evaluation, No water shall have entered enclosure

6.5.1.1 (2) Outdoor Dust Test (alternate method) - Stream of water at 45 gallons per minute from a 1" diameter nozzle, from all directions at a distance from 10' to 12'. Test time is a minimum of 5 minutes. No water shall enter enclosure.

6.5.1.2 (2) Indoor Dust Test (alternate method) - Atomized water at 30 psi is sprayed from all directions from a distance of 12" to 15" at a rate of 3 gallons per hour. No water shall enter enclosure.

6.6 External Icing Test - The enclosure is sprayed with water between 0°C and 3°C in a room at 2°C. The spray is between 1 and 2 gallons per hour per square foot. Spray for 1 hour. The room temp is then dropped to between -7°C and -3°C with the spray still going. Ice needs to build up on a test bar at a rate of 1/4 inch per hour. Spray continues until 3/4 inch of ice is on the enclosure. Room temperature is maintained for at least 3 hours. 6.6.2.2 Evaluation, enclosure is undamaged after ice has melted.

6.7 Hose down Test - Stream of water at 65 gallons per minute from a 1" diameter nozzle from all angles at a distance of 10' to 12'. Test time is 48 seconds times (height + width + depth of enclosure in feet) or a minimum of 5 seconds. No water shall enter enclosure.

6.8 Rust Resistance Test - only applicable to enclosures incorporating external ferrous parts

6.9 Corrosion Protection - Test per UL 508, 6.9 or 6.10.

6.11 (2) Air Pressure Test (alternate method) - Enclosure is submerged in water at a pressure equal to a depth of 6' for 24 hours. No water shall enter enclosure.

6.12 Oil Exclusion Test - Stream of test liquid at 2 gallons per minute from a 3/8" nozzle for 30 minutes. Water with 0.1% wetting agent is directed from all angles from a distance of 12" to 18". No test liquid shall enter the enclosure.

Installing Cable Products in Accordance with the National Electrical Code (NEC)

The NEC is a set of guidelines for installation of electrical devices, including cables, meant to reduce the risk of electrical shock, fire, etc. The NEC is simply a code and local laws may or may not require installation based on the NEC. Check local laws for applicability.

The NEC generally does not cover cables installed inside a machine. Any cables installed in an exposed manner, on the outside of a machine or from one machine to something else, must be an approved type and installed in accordance with the appropriate NEC articles.

UL (Underwriters Laboratory) and CSA (Canadian Standards Association) are the primary sources in North America for approving cables to specific standards. While a cable installed within a piece of machinery does not fall under the NEC, most people want to install an approved cable. **TURCK** cables have both UL and CSA approvals. Many of these approvals are the UL AWM (Appliance Wiring) approvals and are acceptable for use in a UL approved device. A UL Listed cable may be installed outside a machine per the NEC standards. UL Listed cables available from **TURCK** include NEC designations for hard duty cables (SOOW, SJOOW, STOOW, SEOW), armored cables (MC), and tray-rated cables (PLTC, ITC).

Hard duty cables designations are:

S - Service Grade (600V)

SJ - Service Grade Junior (300V)

ST - Service Grade Thermoplastic (600V)

SE - Service Grade Thermoplastic Elastomer (600V)

O - Oil resistant jacket material

OO - Oil resistant jacket and conductor insulation

W - Weather proof

TURCK armored cables are available in 3 different configurations. Type MC cables, type MC cables with ITC/PLTC approvals and simply ITC/PLTC approved. Armored cables with ITC/PLTC approvals may be installed in an exposed run without being offered additional mechanical protection.

Tray-rated cables from **TURCK** include Instrument Tray Cable (ITC) and/or Power Limited Tray Cable (PLTC).

TURCK NEC type approved cables are dual listed with other UL type approvals. For example, the RKM 126-*M cordset has a 12 conductor 16 AWG cable with UL AWM 600V approval and ITC/PLTC approval.

Please refer to the NEC and local laws for specific installation requirements based on your environment.

Cable Applications

Proper management of cabling systems can mean the difference between a dependable and smooth operating installation and costly reoccurring down time. The suggestions outlined below illustrate some of the common sources of problems and provide simple and effective solutions.

Proper Bend Radius for Fixed and Moving Applications

Providing sufficient bend radius will allow the cable to absorb the energy of bending over a greater portion of its length, increasing its effective working life. Small increases in the radius of the bend can produce substantial increases in cable life.

Fixed Applications:
Minimum bend radius 5x cable diameter

Moving Applications:
Minimum bend radius 10x cable diameter

Eliminating Stress Points in Cable Dress

Installing cables to allow for adequate stress loops and freedom of motion increase the life of the cables. **TURCK** cordsets incorporate molded strain reliefs that will assist in preventing stress.

Tie Down Loops

Correct

Incorrect

Strain Relief

Correct

Incorrect

Cable Bundling Techniques

When bundling several cables together, always keep the bundle loose enough to move within itself. Tightly tied bundles create both compression and tension stresses when the bundle is moved.

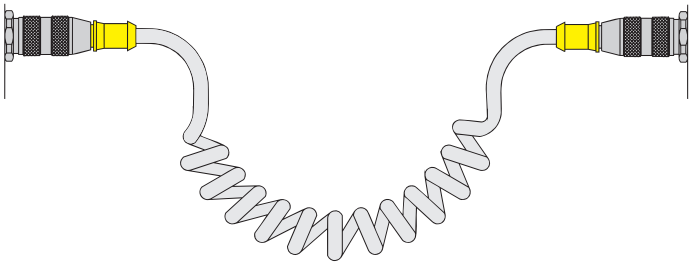
Correct

Incorrect

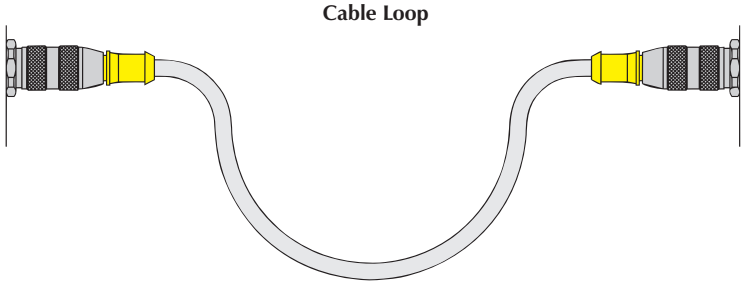
Cabling for Motion Applications

Where cabling is subjected to linear, angular or rotational motion between two points, always allow adequate cable length to absorb the energy imparted by the motion. Use of coiled cords, mechanical support mechanisms, or large, well supported cable loops will maximize cable life.

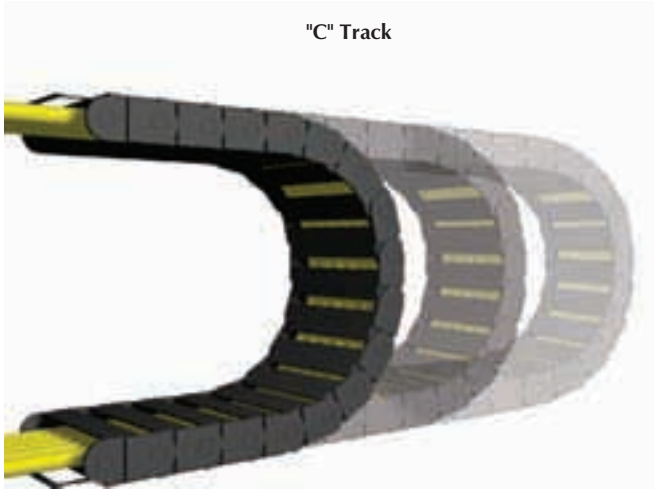
Coil Cord



Cable Loop



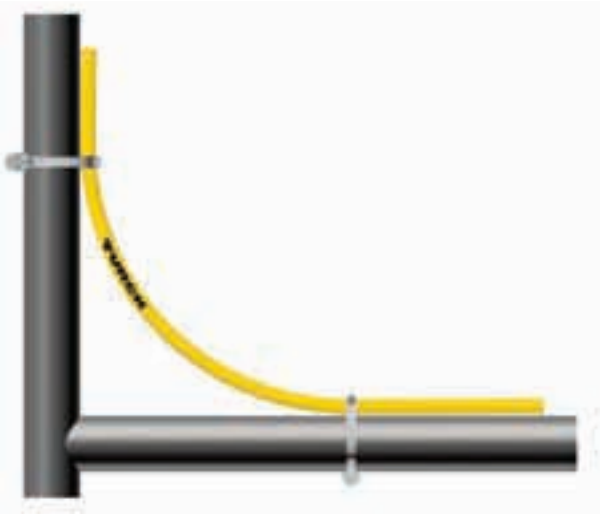
"C" Track



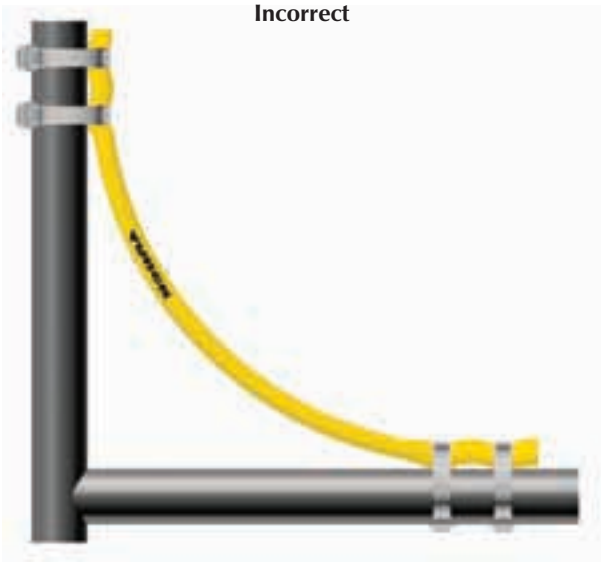
Tying Cables with Cable Ties

When tying cable with self locking cable ties, always leave the ties loose enough for the cables to slide freely under the tie. Over tightening will create stress concentrations that can cause the conductors to fail prematurely. Never tighten the tie to the point where the cable jacket becomes deformed or pinched.

Correct



Incorrect



Installation Instructions for TURCK's *minifast*® and *eurofast*® Connectivity Products

Follow these simple steps to ensure that your **TURCK** connectivity products are installed for best performance and safety.

Step One:

Many instruments are available with a **TURCK** receptacle pre-installed. If a receptacle is already installed, proceed to Step Two. If field installation of a receptacle is necessary, feed the receptacle leads through the instrument's conduit entry and thread the receptacle into the entry threads. Receptacles with NPT threads should be tightened per the requirements for NPT conduit fittings. Receptacles with straight threads (M20 or NPSM) should be tightened to deflect the O-ring just sufficiently to effect a good seal. The receptacle leads should then be connected to the terminals of the instrument. Consult the instrument manual for terminal identification and preferred method of connection. Also, please refer to the product catalog or online at www.turck.com for the pin-out of the receptacle.

Step Two:

minifast connectors are designed to industry standards SAE H1738 and ANSI/B93.55M. The environmental seal for mated connectors is formed by the 'cork and bottle' design of the pin and socket carriers in which each connection chamber is individually sealed. The connection must be properly secured to achieve this seal, as well as to ensure a good electrical performance.

The keyed cordset should be aligned with the key on the instrument receptacle. The cordset should then be pushed into the receptacle and the coupling nut turned until hand tight. The cordset should then be pushed firmly into the receptacle a second time and the coupling nut hand tightened again. This generally allows an additional 1/8 - 1/4 turn and ensures that a tight, weather-proof connection is made. No tools should be used in tightening the connections, as damage to the contacts could occur if the connection is over-tightened.

eurofast connectors are designed to industry standard SAE H1738. The environmental seal for mated connectors is formed by an O-ring seal. The connection must be properly secured to achieve this seal, as well as to ensure a good electrical performance.

The keyed cordset should be aligned with the key on the instrument receptacle. The cordset should then be pushed into the receptacle and the couple nut turned until hand tight. While rotating the coupling nut, the installer may notice a 'ratcheting' sensation. This is an anti-vibration feature designed to maintain the connection in high-vibration environments. No tools should be used in tightening the connection, as damage to the contacts could occur if the connection is over-tightened.

Installation Instructions for TURCK's *minifast* ® and *eurofast* ® Connectivity Products

Step Three:

Most **TURCK** process wiring products are designed and approved for use in hazardous locations. If the installation is in a hazardous location, there may be additional actions necessary, such as locking the connection with a ***lokfast***™ guard (as shown in the figure below), using an approved energy limiting source of power, or ensuring that the instrument has the appropriate approval. FM approved control drawings detail the requirements for compliant installation of **TURCK** products. The appropriate control drawing number will be identified in the product markings and may be viewed or downloaded from www.turck.com/fmcd. Consult the instrument manual to ensure the instrument has the appropriate approval and to determine if the approval imposes any additional constraints.

Valve Position Sensors

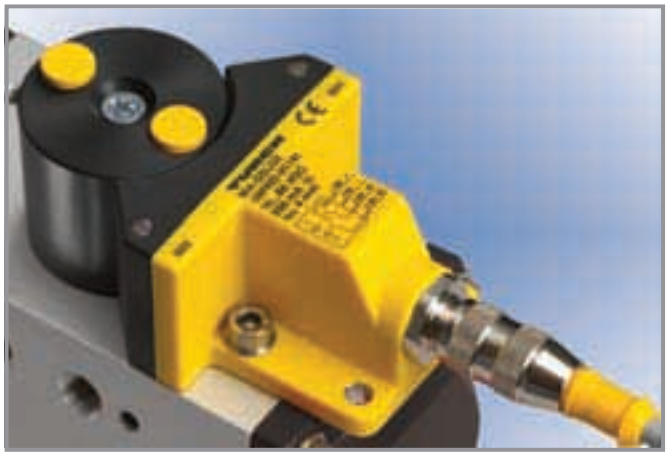
Position control in actuators and drives is essential in most chemical, petrochemical, and food industry applications. **TURCK** valve position sensors provide a quality solution to valve position feedback in a variety of applications. Each industry has different needs, and while the DS20 series works well in most general applications, **TURCK** has created a variety of styles that were designed with specific industries in mind.

Rising stem valve shown with TURCK *Vprox*® *773* sensors.

Chemical and Petrochemical Industries

The DSU35 provides superior protection against environmental influences, and is highly resistant to harsh chemicals, making it the ideal choice for chemical and petrochemical applications. This sensor and target puck can be mounted to several different actuator sizes without the need for adapters or spacer plates. The DSU35 is available with numerous outputs circuits such as a 2-wire DC, 2-wire NAMUR, 2-wire AC/DC, as well as with DeviceNet ™ and AS-I bus protocols. We also offer the DSU35 with a terminal chamber, which is often a requirement in chemical process applications where conduit must be used.



Food & Beverage Industries

TURCK uses injection-molding technology to make the compact DSC26 sensor, ensuring that it is fully sealed and well suited in wet surroundings. These features make the DSC26 ideal for use in a number of food or beverage applications. The DSC26 has a smooth housing which makes it easy to clean, yet it also has a high degree of protection against high pressure cleaning, and is highly resistant to aggressive cleaning agents.

Overview

TURCK has met with market demand to create an extensive line of valve position sensors. With a variety of standard ***eurofast***®, ***microfast***®, and ***minifast***® connections available, **TURCK's** dual sensors reduce installation costs and minimize the cost of maintenance. These robust and impact resistant sensors are ideal when valve position information must be provided.

Valve Position Sensor Part Number Key

Part Number Keys are to assist in IDENTIFICATION ONLY. Consult factory for catalog items not identified.

Mounting

B = Embeddable
N = Nonembeddable

Principle of Operation

I = Inductive

Rated Operating Distance (mm)

Housing Style

EG16CA = Stainless Steel 5/8 -18 UNF; 1/2-14 NPT
DSU = Dual Sensor Universal
DS = Dual Sensor
DSC = Dual Sensor Compact

Housing Height

20 = 20 mm
26 = 26 mm
35 = 35 mm

Housing Modifier

TC = Terminal Chamber

Number of Outputs

2 = Dual Output
Blank = Single Output

Output Function

A = Normally Open
F = Connection Programmable
Y0 = NAMUR Output, Requires Remote Amplifier
Y1 = NAMUR Output, Requires Remote Amplifier

Output

ASI = AS-I Protocol
DZ = 2-Wire AC/DC
DNET = DeviceNet™ Protocol
N = NPN (Current Sinking)
P = PNP (Current Sourcing)
Z = 2-Wire AC/DC

Voltage Range

4 = 10-65 VDC (SCP)*
6 = 10-30 VDC (SCP)*
30 = 20-250 VAC; 10-300 VDC (SCP)*
31 = 20-250 VAC; 10-300 VDC (No SCP)
32 = 20-250 VAC; 10-300 VDC (SCP)*

* Short-Circuit Protection

Number of LEDs

Blank = No LEDs
X2 = 2 LEDs

Connector Family

B1 = ***minifast***®, Metal, Male
H1 = ***eurofast***®, Metal, Male

Connector / Sensor Transition

1 = Straight
3 = Straight with Adapter

Number of Pins

Factory Code

Dual DC NAMUR – Y0, Y1

Temperature Drift	≤±10%
Differential Travel (Hysteresis)	1-10% (5% typical)
Nominal Voltage	8.2 VDC (EN60947-5-6)
Resistance Change from Nonactivated to Activated Condition	Typical <1.0 to >8.0 kΩ
Rated Insulation Voltage	≤1.5 kV
Resulting Current Change	≥2.2 mA to ≤1.0 mA
Recommended Switching Point for Remote Amplifier	>1.2 to <2.1 mA, typ. 1.55 mA ON/1.75 mA OFF
Power-On Effect	Realized in Amplifier
Reverse Polarity Protection	Yes, up to 10 VDC
Wire-Break Protection	Realized in Amplifier
Transient Protection	Realized in Amplifier
Shock	30 g, 11 ms
Vibration	55 Hz, 1 mm Amplitude in all 3 Planes
Repeatability	≤2% of Rated Operating Distance
Short-Circuit Protection	Yes, when connected to NAMUR amplifier up to 15 VDC

Dual AC/DC without Short-Circuit Protection – ADZ31, ADZ35

Temperature Drift	≤±10%
Line Frequency	40-60 Hz
Differential Travel (Hysteresis)	3-15% (5% typical)
Voltage Drop Across Conducting Sensor	≤6.0 V at 400 mA
Off-State (Leakage) Current	≤1.7 mA
Minimum Load Current	≥5.0 mA
Inrush Current	≤8.0 A (≤10 ms, 5% Duty Cycle)
Power-On Effect	Per IEC 947-5-2
Transient Protection	Per EN 60947-5-2
Shock	30 g, 11 ms
Vibration	55 Hz, 1 mm Amplitude in all 3 Planes
Repeatability	≤2% of Rated Operating Distance
Short-Circuit Protection	No

Dual AC/DC with Short-Circuit Protection – ADZ30, ADZ32, FDZ32

Temperature Drift	≤±10%
Line Frequency	40-60 Hz
Differential Travel (Hysteresis)	3-15% (5% typical)
Voltage Drop Across Conducting Sensor	≤6.0 V at 400 mA; 8 & 12 mm ≤6.0 V at 100 mA
Trigger Current for Overload Protection	AC: ≥440 mA; DC: ≥330 mA
Rated Insulation Voltage	≤1.5 kV
Off-State (Leakage) Current	≤1.7 mA (AC) ≤1.5 mA (DC)
Minimum Load Current	≥3.0 mA
Inrush Current	4.0 A (≤20 ms, 10% Duty Cycle)
Power-On Effect	Per IEC 947-5-2
Transient Protection	Per EN 60947-5-2
Shock	30 g, 11 ms
Vibration	55 Hz, 1 mm Amplitude in all 3 Planes
Repeatability	≤2% of Rated Operating Distance
Short-Circuit Protection	Yes

Dual DC or Discrete Output – 2AP4X2, 2AP6X2, 2AN4X2, 2AN6X2

Temperature Drift	≤±10%
Ripple	≤10%
Differential Travel (Hysteresis)	3-15% (5% typical)
Voltage Drop Across Conducting Sensor	≤1.8 V
Rated Insulation Voltage	≤0.5 kV
Trigger Current for Overload Protection	≥220 mA on 200 mA Load Current ≥170 mA on 150 mA Load Current ≥120 mA on 100 mA Load Current
Off-State (Leakage) Current	<100 µA
No-Load Current	<10 mA
Time Delay Before Availability	≤8 ms
Power-On Effect	Per IEC 947-5-2
Reverse Polarity Protection	Incorporated
Wire-Break Protection	Incorporated
Transient Protection	Per EN 60947-5-2
Shock	30 g, 11 ms
Vibration	55 Hz, 1 mm Amplitude in all 3 Planes
Repeatability	≤2% of Rated Operating Distance
Short-Circuit Protection	Yes

EZ-track®

TURCK's *EZ-track* line of linear displacement transducers (LDTs) is the latest offering in **TURCK**'s continuous effort to change the shape of sensing. Based on magnetostrictive technology, the ***EZ-track*** line will reliably operate in the harsh conditions for which **TURCK** products are known to withstand. With its unique features, IP 67 or optional IP 68 environmental rating, easy mounting and absolute positioning, the ***EZ-track*** line will be sure to fit into your tough linear sensing applications.

Features and Benefits

Non-Contact Sensing Reduces Wear, Breakage, Downtime, and Ultimately Cost

TURCK's ***EZ-track*** line is a family of magnetostrictive LDTs. These non-contact devices detect the position of an external magnet along the active stroke of the sensor without causing any wear on the sensor parts. Because there are no parts to wear or break, the sensors can offer better performance over a longer life than competing technologies. ***EZ-track*** LDTs also offer an alternative when a continuous, absolute reading is necessary in the application.

The absolute reading allows the sensor to accurately determine the position at power ON without the need to set up a home position. With this technology, repeatability of up to +/- 0.001% of full stroke can be achieved. See specifications for detailed information on each product family.

Fast Connections

As a leading supplier of connectivity products, **TURCK** delivers the complete package. Standard, shielded 4 and 5-pin M12 ***eurofast***® cables are always available from **TURCK** for quick connection to ***EZ-track***.

IP 67 / IP 68 (optional)

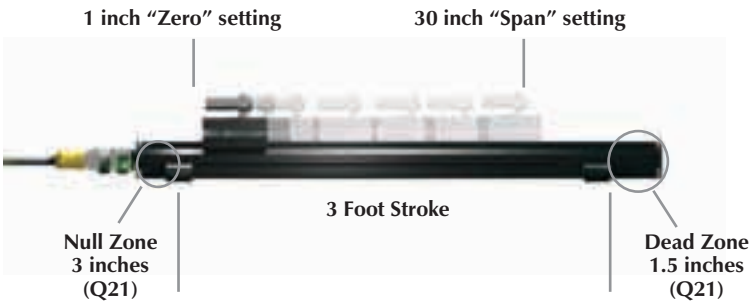
The ***EZ-track*** line will stand up in harsh environments, thus downtime situations due to environmental conditions can be reduced. Standard units have an environmental rating of IP 67, however IP 68 versions are also available. Consult factory for details.

EZ-track® General Overview

Programable Stroke

Programmable Zero and Span Allow Standard Sensors to Have Customized Stroke Lengths, Eliminating the Need to Stock Numerous Models

EZ-track's analog outputs are not limited to the entire length of the sensor. The zero and span settings can be programmed anywhere along the active stroke. By utilizing this feature, the user can reduce stock levels for various length LDTs used in the plant by replacing them with standard sizes and programming to the specific applications. The **Q21** profile style transducers are available in stroke lengths up to 180 inches.



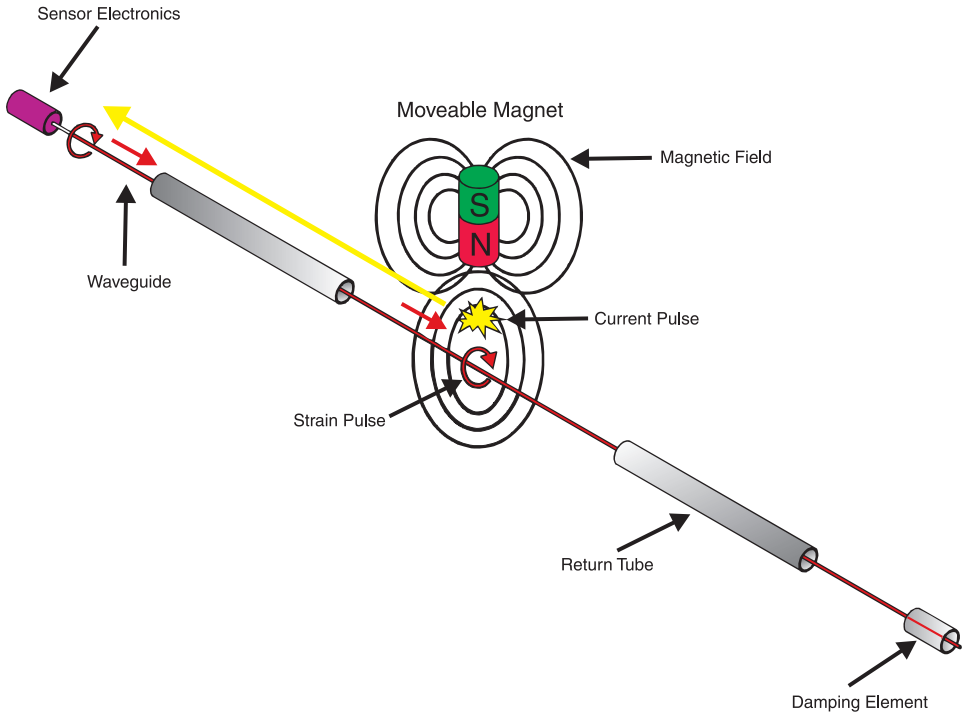
To Program the *EZ-track* Sensor:

Short pin 2 to pin 3 to obtain "Zero" setting, short pin 2 to pin 1 to obtain "Span" setting, or use **TURCK**'s RP-Q21 Programmer.

Reliable Accurate Technology

EZ-track® LDTs profile style probes use magnetostrictive technology by applying a mechanical strain pulse to a magnetostrictive waveguide that runs the length of the sensor. When the strain pulse encounters a magnetic field produced by the slide or floating magnet assembly, a current pulse is produced that is picked up by the electronic circuitry. A high speed timer measures the time difference between the applied strain pulse and the return of the induced current pulse. This time, proportional to position, is compared to the "zero" and "span" positions established during the calibration process to scale the output. Once the position has been scaled accordingly, it is converted to a signal in the form of an analog (voltage or current) output, quadrature pulse output, or digital (PWM or start/stop) outputs.

In the **Q21R** the magnetostrictive effect is used in the opposite manner, in that a current pulse is induced and a strain pulse returns to the sensor electronics. Utilizing the magnetostrictive effect gives you highly accurate, non-contact absolute position sensing with no wear on the sensing element.



Applications

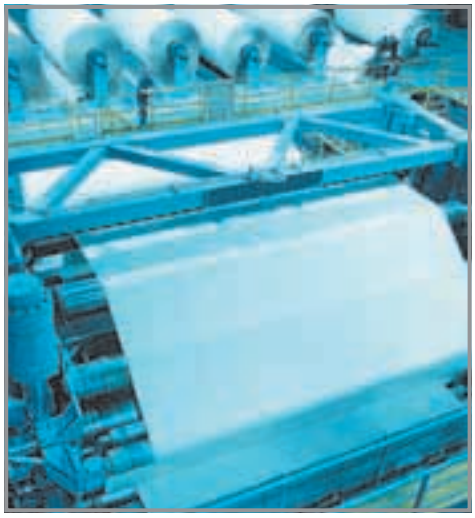
- **Hydraulic Cylinders**
- **Injection / Blow Molding**
- **Palletizers**
- **Foundries**
- **Packaging Machines**
- **Die Casting**
- **Medical Systems**
- **X-Y Axis Positioning**
- **Elevators**
- **Extruding Equipment**
- **Valve / Actuator Position**
- **Material Handling**
- **Laminating / Gluing Machines**
- **Saw Mills / Lumber Equipment**
- **Cutting / Slitting Machines**
- **Amusement Park Rides**
- **Flight Simulators**
- **Side Guides**

Analog Profile Series

Low Profile Extrusion Housing

Low Profile Housings Reduce Mounting Restrictions and Eliminate Special Mounting Fixtures

The **Q21** series is housed in low profile, environmentally sealed, anodized aluminum housings. The electronics and the sensing element are incorporated into a housing that is less than 1 inch tall without the need for a can or head on the sensor to house the electronics (typical competitive devices are 2.5 times larger). By reducing the profile of the sensor lessens mounting issues, and allows the **Q21** series to fit into applications where others are too bulky.

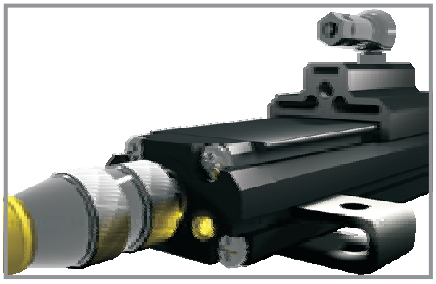


Diagnostic LED

An LED Indicating the Status of the Sensor Simplifies Troubleshooting and Reduces Maintenance

The ***EZ-track***® Series utilizes a diagnostic LED that enables the operator to understand the state of the sensor dependent upon the position of the target magnet.

The LED is green when the power is on and the magnet is in an active programmed area.



The LED turns yellow when the magnet moves out of the programmed area, but is still within the active stroke.

The LED turns red when there is no magnet present or it is in the null or dead zones.

The LED flashes to indicate it is in AGC mode (**Q21**).
This feature simplifies programming and troubleshooting, effectively reducing setup and maintenance time.

Various Analog Outputs Available Profile Style

The **Q21** series can be ordered in a variety of outputs.

Voltage:	Current:	Quadrature:
0-10 VDC	4-20 mA	10 kHz to 1 MHz
10-0 VDC	20-4 mA	
-10 to 10 VDC		
10 to -10 VDC		
0-5 VDC		
5-0 VDC		
-5 to 5 VDC		
5 to -5 VDC		

Although sensors can be ordered with any of the above outputs, the units can easily be changed in the field to reverse the analog signal. Thus, one model can be used for two applications by programming the "zero" and "span" appropriately.

Automatic Gain Control

The Automatic Gain Control (AGC) feature allows the ***EZ-track***® to sense a magnet other than the standard slide magnet and adjust to the magnetic field strength accordingly. With the ability to sense a standard floating magnet up to 3/8 inch away, the user has greater mounting flexibility for various applications.

FM Approved Installation (Class I, Division 2)

The ***EZ-track* Q21** unit can be ordered for use in a Class I, Division 2 environment. The unit will utilize a Euro-G Fast-Lock, as shown below. See page L37 for part number key and ordering information (S1690 unit rating option).

Quadrature Profile Series

Direct Quadrature Output

Reduce installation time, vendors and cost by directly interfacing to the PLC input card

The **Q21-DQ** provides a quadrature output directly from the transducer to the controller. The **Q21-DQ** provides A and B channel quadrature output signals that are proportional to the position of the magnet assembly along the length of the probe. The quadrature output makes it possible to have a direct interface to virtually any incremental encoder input or counter card, eliminating costly absolute encoder converters and special PLC interface modules. An index channel (Z) is also provided and its position can be set by the user at any position along the active system. The A, B and Z channels are differential outputs. That is, the connection for each output consists of two signal wires. These are typically described as the "+" and "-" signals. Differential signals are much less prone to interference caused by electrical noise or ground loops more often found in single ended connections.

Replace Incremental Output Devices

The **Q21-DQ** can be used in certain applications to replace incremental rotary and linear encoders. The quadrature output can be used in applications requiring 0.001 inch resolution and repeatability.

Velocity Feedback

The ***EZ-track*** quadrature produces pulses that are sent to the controller in packets at a fixed frequency. The period of the pulses do not change with magnet velocity. Therefore, velocity can not be determined from the pulse packets unless the controller can interpolate velocity from position over time. If your application requires a velocity feedback, please consider the Linear Encoder on pages M4-M5 or consult factory.

Incremental Output, Absolute Functionality

No need to home the machine at start up or after power failure

The **Q21-DQ** allows you to use an incremental style of output while taking advantage of an absolute sensing technology. The Burst Input on the transducer triggers a data transfer of all incremental position data relative to the transducer's zero position. This can be used to achieve absolute position updates when power is restored to the system or anytime an update is needed to re-zero or home the machine.

Programmable Zero Point

The Zero Input allows you to set the probes reference position at any point along the active stroke. The probe will output an increasing or decreasing signal based on the direction the magnet is moving in relation to the established zero point.
See Quadrature Part Number Key to select storage mode.

Volatile Storage - the zero point will be kept until a new zero pulse is sent or until the probe loses power. The zero point can be programmed an infinite number of times.

Non-Volatile Storage - the probe will store the zero position even in the event of a power failure. The zero point can be set 100,000 times.

Quadrature Profile Series

Transducer Inputs

The *Burst* and *Zero* Inputs are single ended connections. That is, the connection for each input consists of only one wire. The **Q21-DQ** is available with either +24 VDC level signal or TTL level thresholds. Additionally, the 24 VDC can be specified as either sinking or sourcing relative to the probe's input.

Quadrature Output Resolution and Speed

The internal resolution of the **Q21-DQ** transducer is 0.001 inches. This would be represented to the encoder input device by specifying an output resolution of 1,000 cycles per inch (CPI).

Frequency or Pulse Rate

For a typical incremental encoder output, the resolution of the encoder and the speed of travel govern the frequency and pulse width of the output pulses. The output pulse rate from the ***EZ-track***® transducer is fixed and controlled internally. This output frequency is user specified (10 kHz to 1MHz) so that it does not exceed the maximum input rate of the counter card. If the controller's maximum input frequency falls between two available frequencies, choose the lower frequency.

Output Drivers

The **Q21-DQ** uses an OL7272 line driver and can be configured for either a TTL level output or a 10-30 VDC level output. Option R has a 5 VDC TTL level output regardless of input power. Option L has an output of 1 volt less than the probe's input voltage and should be used when driving input cards that are not TTL compatible.

Digital Profile Series

The **Q21D** is a non-contact LDT with a digital output. This transducer utilizes magnetostrictive technology to give absolute position that is repeatable to .006% of the active sensing distance. It also has the same auto-tuning capability that the other profile series transducers offer so that it can adjust its signal strength to various magnets. There is a diagnostic LED that is located at the connector end of the probe and provides visual status information regarding the operation of the **Q21D**. The indications are as follows:

Green: Magnet is present and within the active range, the LED will remain illuminated continuously during normal operation.

Red: Fault, the LDT has lost its signal from the magnet or the magnet has moved into the Null or Dead Zone.

Yellow: No external interrogation pulse is detected.

The **Q21D** digital transducer provides either a Start/Stop or a Variable Pulse signal interface that is proportional to the position of the slide magnet assembly along the length of the probe.

Start/Stop (RS)

The Start/Stop signal interface of the **Q21D** digital output series is a differential RS-422 output. To initiate a start pulse, an external device must be used, and should be a minimum of 1ms in duration. A stop pulse of 1 ms in duration will follow. The time delay from the leading edge of the start pulse to the leading edge of the stop pulse is proportional to the distance form the Null Zone to the Magnet.

Digital Profile Series

Variable Pulse (VP)

The Variable Pulse interface digital output is a pulse width modulated signal (RS-422). The **Q21D** LDT can be ordered with either external **(VPE)** or internal **(VPI)** interrogation.

External interrogation occurs when an external device connected to the **Q21D-VPE** generates a start pulse. This start pulse should be a minimum of 1 ms in duration. Within 50 nanoseconds after the leading edge of the start pulse has been received, the LDT will generate an output pulse. The duration of the output pulse is proportional to the distance from the Null Zone to the Magnet.

The **Q21D-VPI** generates an internal interrogation, and will continually output pulse width modulated signals. The duration of this output pulse is also proportional to the distance from the Null Zone to The Magnet.

Hazardous Area Proximity Sensors

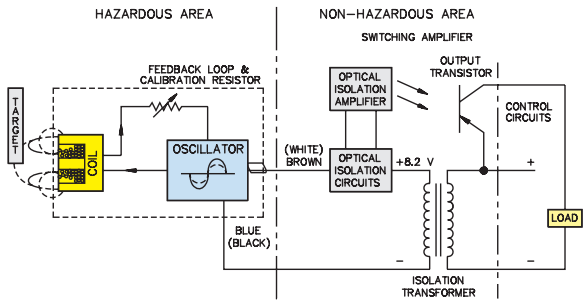
TURCK NAMUR proximity sensors are 2-wire sensing devices meeting the interoperability requirements of EN 60947-5-6. Because NAMUR sensors operate on very low power, they can be designed to be intrinsically safe for use in hazardous locations. Turck NAMUR compliant sensors have intrinsic safety approval from FM, CSA, ATEX and others.

The operation of NAMUR sensors is similar to that of a variable resistor, with a change of impedance as a target approaches the sensor. When no metal is being sensed, an inductive sensor is in a low impedance state and draws a current of more than 2.2 mA. When a metal target enters the high-frequency field radiated from the sensor face, the impedance increases as the target approaches. When fully damped, the sensor draws less than 1.0 mA. This current change is used to trigger an external amplifier at a defined switch point, usually about 1.5 mA.

Figure 1



NAMUR sensors contain a relatively small number of components, which allows the construction of small devices and helps to ensure a high degree of reliability. As the sensors are 2-wire current loops with fairly low impedance, they are unaffected by most transients.

General NAMUR Specifications

Differential Travel (Hysteresis) . . . . . 1-10% (5% typical)
Nominal Voltage . . . . . 8.2 VDC (EN60947-5-6)
Resistance Change from
Nonactivated to Activated Condition . . . . . typical <1.0 to >8.0 kΩ
Resulting Current Change . . . . . ≥2.2 mA to ≤1.0 mA
Recommended Switching Point for
Remote Amplifier . . . . . >1.2 to <2.1 mA, typ. 1.55 mA ON/1.75 mA OFF
Power-On Effect . . . . . Realized in Amplifier
Reverse Polarity Protection . . . . . Incorporated
Wire-Break Protection . . . . . Realized in Amplifier
Transient Protection . . . . . Realized in Amplifier
Shock . . . . . 30 g, 11 ms
Vibration . . . . . 55 Hz, 1 mm Amplitude in all 3 Planes
Repeatability . . . . . ≤2% of Rated Operating Distance

See **TURCK** Sensors Catalog for detailed individual specifications for all NAMUR sensors.

TURCK NAMUR proximity sensors are functionally compatible with all switch amplifiers with input characteristics that meet the NAMUR requirements. Their approved intrinsic safety entity parameters are compatible with all **TURCK** safety switch amplifiers and remote I/O systems. See Section B, IS Interface Technology, and Section C, IP 20 Slice I/O, for more information.

Class I, Division 2 Hazardous Area Sensors

TURCK 3-wire DC proximity sensors with code AN6., AP6., RN6., or RP6. with threaded barrels are approved by FM Approvals for installation in Class I, Division 2 hazardous locations. The sensors must be installed using a Division 2 wiring method, which, for all practical purposes, means that the sensor must be either installed in an enclosure that requires the use of a tool to open, or they must be adapted to a raceway or conduit product. **TURCK** TMF conduit adapters or other suitable thread adapters may be used for this purpose.

Conduit Adapters

When installed in this fashion and powered from a supply not exceeding 30 VDC, there are no further energy limiting or protective enclosure requirements for installation in Class I, Division 2. The sensors have no arcing or sparking components and will not dissipate heat under normal operating conditions.

Part Number	ID Number	Barrel Diameter	Dimensions					
			A	B	C	D	E	F
TMF 12-G	A3310	12 mm	1.15 [29.2]	1.00 [25.4]	1.00 [25.4]	0.50 [12.7]	0.50 [12.7]	M12x1

TURCK Pressure Controls Offer a Flexible Solution to Any Pressure Application

Designed with Features to Meet your Needs

The complete line of **TURCK** pressure controls present a wide range of pressure-sensing products that have been designed for versatility and efficiency in a variety of pressure monitoring applications. Our electronic pressure controls are well suited for use in pneumatic and hydraulic systems where there is a need to monitor, measure or control the pressure of both liquids and gases. If your application requires pressure monitoring, **TURCK** pressure controls are the right choice for you.

Solid State Reliability

The piezo-resistive measuring cells offer an extremely high overpressure resistance, which in turn produces a pressure control that is remarkably stable. The robust housings and ceramic piezo-resistive measuring cells combined with solid-state reliability give these controls a 10 million-cycle rating. The high shock and vibration resistance allow these devices to function safely and reliably even in the harshest of environmental conditions.

Pressure Controls from TURCK for Multiple Applications

TURCK pressure controls can be used in a wide variety of applications with either liquids or gases. Whether it's control in hydraulic systems or monitoring of pressure in welding guns, **TURCK** pressure controls are designed to provide reliable data in your harshest application.

Some common applications include:

- Air Compressors
- Hydraulic Clamping Systems
- Bad Filter Detection
- Vacuum for Pick-up and Transfer of Product
- Pneumatic Systems
- Hydraulic Accumulators
- Injection Molding Machines
- Press Machines
- Automotive Welding Pressure
- Machine Coolant
- Pump Run Dry

Implementing process control into your system should not require a redesign of your process. Why not choose a sensor that can be modified to meet your unique specifications? Robust, solid state, and available in several programmable styles - the **TURCK** Pressure Controls have the flexibility to adapt and perform in many applications.

A Pressure Sensor Designed with the Customer Applications in Mind

- **High Accuracy**

  The PS400 and PS500 provide an accuracy rating of ±0.5 percent of full scale.

- **Flexible Mounting Options**

  Multiple threaded connections and a unique coupling (PS500) make them easy to mount in a variety of applications.

- **Easy to Operate**

  Push buttons and enter keys for quick and easy programming.

- **Robust Design**

  An environmental rating of IP 67 provide operational durability in harsh applications.

Simple Programming

The new high accuracy programmable pressure sensors combine high accuracy and performance with simple programming, resulting in an extremely user friendly sensor. The sensor is easily programmed via three controls: two push buttons for scrolling through programming features, and one recessed enter key. The push buttons are finger operated, and used to make value selections in the menu or to scroll through the various menu options. The recessed button is used to store selected values, and prevents programmed values from being inadvertently altered.

The menu is clear and concise to allow parameters such as set points, reset points, output functions, analog ranges, and a range of special options to be programmed with ease. The menu also includes an optional electronic lockout that disables the push buttons from functioning until the lockout is removed.

Stock Reduction

The PS400 and PS500 sensors are specified with an accuracy of 0.5 percent exceeding what is required by the machine engineering sector. The combination of high accuracy and flexible programming often allows a single sensor to replace several conventional sensors (with varying sensing ranges) resulting in a significant reduction in inventory. The LI2UPN8X output version allows the user to select current analog output with 1 set point or 2 set points. This allows 1 sensor to replace two part numbers.

Flexible Mounting Options

The high accuracy programable pressure sensors feature a large, bright, 4-digit, 7-segment LCD display with a constant indication of pressure in either psi (pounds per square inch), bar, kPa (kilopascals), or MPa (megapascals). This display is tilted at a 45° angle, and can be inverted electronically for easy reading in a variety of applications. IO user selectable units include: millibar, millimeters or mercury, inches of water, feet of water, inch of #g Mercury, meter of water and kilograms per square centimeter.

The PS400 and PS500 pressure sensors are encased in a compact, 34 mm diameter housing with various threaded connections for simple, versatile installation. This allows several sensors to be mounted in close proximity to one another, and is advantageous when space is at a premium. The PS500 series also features a process connection that allows the housing to rotate 360 degrees for optimal viewing prior to locking the sensor in place. These features allow the PS400 and PS500 pressure sensors to be utilized in a wide variety of applications.

Robust Design

The innovative PS400 and PS500 pressure sensors were designed to tolerate tough applications. Stainless steel housing with an integrated stainless steel M12 ***eurofast***® connector enables fast and reliable installation. The sensors also offer a variety of stainless steel pressure connections including G1/4 and 1/4-18 NPT threads.

The sensors are highly resistant to overpressure and burst pressure, yet they also incorporate a patented medium stop system that prevents leakage when these levels are exceeded. The media stop system immediately seals the sensor if the pressure cell has been damaged, and can prevent liquid leakage if burst pressure is exceeded.

Noise Immune

The PS400 and PS500 programmable sensors offer a high level of protection against interference from sources that produce high levels of EMI (such as frequency converters and stepper motors) and other plant noise. These features were incorporated to create a pressure sensor ideal for use virtually anywhere.

Tough Industrial Pressure Transmitters

TURCK's industrial pressure transmitters combine the reliability of solid-state design with the durability of Stainless Steel. The result is a pressure transmitter that provides accurate and dependable pressure measurement in demanding applications. At the heart of the transmitter is a proven ceramic component technology that provides long-term stability and a high tolerance to overpressure conditions. A patented media stop, included with devices rated over 600 bar, contains the process media in the event that the burst pressure is exceeded. The housing is constructed of Stainless Steel and provides an IP 67 level of protection. The fluid connection is a standard G 1/4 or 1/4 NPT thread that works with all of **TURCK's** existing pressure accessories. All of the transmitters include an M12x1 ***eurofast*** ® quick disconnect, making them compatible with **TURCK's** extensive line of cordsets and junction boxes.

TURCK Pressure Sensors and Transmitters with Diaphragms Installed

Operation

In many pressure applications, there is a need to separate the pressure sensor from the media it is sensing via an isolation device. **TURCK** offers a variety of diaphragm seals that are attached either directly or remotely to the pressure device to provide this isolation. The diaphragms that **TURCK** offers are all manufactured and installed by PI Components, and are not available as a separate item. This insures that the quality of the assembly is maintained for optimum accuracy.

The **TURCK** pressure sensor is attached into the top of the diaphragm housing, which is then filled with fluid. The sensor receives the pressure hydraulically via this internal medium. The lower half of the diaphragm housing adapts to the process connection, and is designed to contain the process medium as it acts against the thin membrane located between the two housings.

Applications

TURCK offers the diaphragms in numerous wetted material options, as well as with many different fill fluids to solve any application. Typical process applications that require the use of a diaphragm include:

- Sanitary Applications
- Corrosive Processes
- Viscous Applications
- Applications Where Freezing Media Can Clog The Sensor

Pressure Transmitter with S1605 Sanitary Diaphragm

Innovative Pressure Sensor and Diaphragm Solutions

TURCK is the market leader in providing innovative sensor solutions for industrial automation applications. **TURCK's** high quality, high performance pressure sensors and pressure transmitters can be combined with multiple styles of diaphragms to give our customers an infinite selection of unique pressure sensing solutions.

TURCK offers diaphragms in numerous wetted material options, as well as with many different fill fluids. This broad selection provides custom sensing solutions for the most diverse pressure applications. Parts numbers should be developed through your **TURCK** representative or application support. In general, the formula below illustrates how to configure a custom sensor and diaphragm assembly.

High Accuracy Programmable Pressure Sensor Specifications

Current Consumption	≤50 mA
Switching Frequency (Discrete)	≤180 Hz
Minimum Hysteresis	±0.5%
Display Reaction Time:	
3 Selectable Modes	Slow 600 ms update Normal 200 ms update Fast 50 ms update
Wetted Parts	Stainless Steel, Viton Al_2O_3 Ceramic
Programmable Analog:	
Analog Start Point	Programmable from 0-75% of measuring range
Analog End Point	Programmable from 25-100% of measuring range
Time Delays:	
Switching Delay	Switch-on and switch-off delay adjustable from 0 to 50 seconds in steps of 0.1 second
Power-On Effect	Per IEC 947-5-2
Reverse Polarity Protection	Yes
Transient Protection	EN 60947-5-2
Short-Circuit Protection	Yes
Temperature Ranges:	
Ambient Temperature	-40° to +80°C (-40° to +176°F)
Medium Temperature	-25° to +85°C (-40° to +185°F)
Enclosure Rating	Meets NEMA 4, 6, 12, 13 and IP 67
Shock	50 g per IEC 68-2-27
Vibration	20 g (10-200 Hz) per IEC 68-2-6
Burst Protection	patented media stop
Accuracy:	
Repeatability	≤±0.5% of measuring range
Zero Shift/Span Shift	≤±0.15% of measuring range/°C
LED Function/Display:	
Measuring Value/Programming	4-digit 7-segment display
Status Display	LEDs indicate output status and selected measuring units
EMC Information:	
EN 61000-4-2	ESD: 4 KD CK/ 8 KV AD
EN 61000-4-3	HF irradiated: 15 V/m
EN 61000-4-4	Burst: 2 KV
EN 61000-4-5	Surge: 500 V, 12 Ω
EN 61000-4-6	HF conducted: 10 V

Programmable Pressure Specifications (Flush Mount)

Current Consumption . . . . . ≤50 mA

A Variety of Flow Sensors for All of Your Flow Applications

The rugged design and high repeatability of **TURCK** flow sensors bring a new level of reliability to flow monitoring. Many sensors have an enclosure rating of IP 67, in addition to a pressure resistance of 1450 psi, while other models are able to withstand aggressive materials such as acids and caustics. **TURCK** flow sensors are available as in-line models, self-contained devices, or probe styles (with a separate signal processor), and are able to perform in many different media, such as liquids, gases and airflow. **TURCK** flow monitors have a temperature gradient of 250°C/minute, which allows them to respond rapidly to changes in temperature and makes them especially suited to applications such as monitoring coolant flow to weld tips. Our wide range of flow products offer a solution to many flow applications.

Solid State with No Moving Parts

All **TURCK** flow sensors are solid-state devices that operate on the calorimetric principle. With this technology there are no moving parts that may break off or become lodged in the pipeline. Often in impure or "dirty" flow applications, mechanical devices tend to become frozen or stuck in the "open" position making **TURCK** electronic sensors a much better choice in these applications. No matter how demanding your application, you now have a solution that installs easily, performs dependably, and does not require expensive downtime.

Product Features

- All wetted parts are made of Stainless Steel, Titanium, Hastelloy or Teflon
- Omni-directional monitoring allows you to monitor the flow in any direction
- Automatic temperature compensation allows for sudden shifts in flow temperature within specified extremes

TURCK offers longer probe lengths for use in applications where there is a larger pipe, or long standoff, in many different probe style flow sensors. These probes are available in 20 millimeter increments with a maximum length of 220 millimeters. Consult factory for more information.

TURCK: Delivering Advanced Automation Products

As the market for automation components continues to evolve and requires smarter, smaller, more robust sensing and productivity products, **TURCK** is rising to meet these challenges with a complete offering of automation components. Established as the industry's leading brand in proximity sensors, the **TURCK** name is synonymous with high-quality, rugged sensing products. Now users can expect that same quality in an expanded offering of automation products that will help improve their processes and profits.

A Digital Read Out Flow Sensor for Your Flow Monitoring Applications

The rugged design and high repeatability of **TURCK**'s Digital Read Out (DRO) flow sensor brings a new level of reliability to flow monitoring. This self-contained, fully programmable sensor allows for both flow and temperature monitoring, and features a highly visible three-digit display that can alternate between flow rate and media temperature when required.

The DRO flow monitor allows the user to program set points specific to an application, and can be programmed to perform in many different media, such as water, glycol and Galden HT110. If the fluid is a glycol/water mix, the percentage of glycol can be selected so that the monitor can adjust to each unique application without the need for factory calibration. The DRO flow monitor has an adjustable filter to smooth out a variety of erratic flow conditions, and is able to monitor changes in flow as low as 0.2 gallons per minute (GPM) or as fast as 12 GPM.

This unique flow monitor can be programmed with two different set points to reflect flow rate. It can be programmed to have one set point monitor flow and one point monitor temperature. A model with 4 set points is also available, where two points monitor flow and two points monitor temperature. And an analog current monitor is available with one set point.

The DRO flow monitor also features programmable on and off time delay functions, and allows the user to define hysteresis for both the flow and temperature set points. It is manufactured with a standard ***eurofast***® M12 connector, has a pressure rating of 145 psi, and can be ordered with a number of different fluid connections; making the DRO flow monitor an economical solution for your demanding flow applications.

Typical Applications:

- Weld Tip Protection
- Transformer Cooling
- Semiconductor Chamber Cooling
- Hot Roller Coolant

Solid-State with No Intrusive or Moving Parts

The DRO flow monitor is an in-line device that approximates flow rate without disrupting the flow. Typical flow monitors often need to be installed by a specialist so that the monitor is precisely oriented to the direction of flow. These devices are also prone to material build up, which can affect the accuracy of the monitor.

The DRO flow monitor is a solid-state device that operates on the calorimetric principle, resulting in a sensor with no moving parts that can break or become lodged in the pipeline. This technology, combined with the in-line mounting of the sensor, allows the DRO flow monitor to perform dependably in a variety of demanding applications without concern for flow restriction or expensive downtime.

Product Features

- Selectable Media Inputs
- Flow/Temperature Readout
- User Programmable Set Points
- User Programmable Keypad
- Mounts Directly Into Pipeline
- 3 Digit - Highly Visible Display
- Adjustable On and Off Delay
- Adjustable Filtering
- Low Pressure Drop
- Solid-State Device
- Stainless Steel Wetted Parts
- Password Protected Programming

Selectable Media

- Water
- Deionized Water
- Ethylene Glycol (0-70%)
- Galden® HT110
- Galden® HT135

DRO Flow - DC

Time Delay Before Availability . . . . . 2-15 seconds (8 seconds typical)
Response Time . . . . . 0.5-3 seconds
Maximum Temperature Gradient . . . . . 250°C / min.

Plastic Self Contained Insertion Probe - DC

Time Delay Before Availability . . . . . 2-15 seconds (8 seconds typical)
Response Time . . . . . 1-15 seconds (2 seconds typical)
Maximum Temperature Gradient . . . . . 250°C / min.

Stainless Steel Self Contained Insertion Probe - DC

Time Delay Before Availability . . . . . 2-15 seconds (8 seconds typical)
Response Time . . . . . 1-15 seconds (2 seconds typical)
Maximum Temperature Gradient . . . . . 250°C / min.

Self Contained Inline - DC

Time Delay Before Availability . . . . . 5-15 seconds (8 seconds typical)
Response Time . . . . . 0.5-3 seconds
Maximum Temperature Gradient . . . . . 400°C / min.

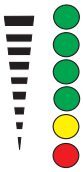
Remote Insertion Probe - DC

Time Delay Before Availability . . . . . 2-15 seconds (8 seconds typical)
Response Time . . . . . 1-13 seconds (2 seconds typical)
Maximum Temperature Gradient . . . . . 250°C / min.

Set-up – Operating and Display Functions

Self Contained Insertion Probe

6 LEDs for flow rate status indication:



4 x green: degree of set point overrange (1, 2, 3, or 4 green LEDs are lit)

1 x yellow: flow is at/above set point
1 x red: flow is below set point

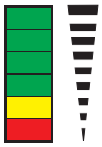
≥20 mA
>16 mA
>12 mA
>8 mA
>4 mA
≤4 mA

Sealing screw (on front of device) covers the potentiometer for switch point adjustment

Potentiometer for adjustment of flow switch point (with analog devices the potentiometer is used to set the measuring range)

Processor MK96

LED display for flow rate status indication:



4 x green: degree of set point overrange (1, 2, 3, or 4 green LEDs are lit)

1 x yellow: flow is at/above set point
1 x red: flow is below set point

≥20 mA
>16 mA
>12 mA
>8 mA
>4 mA
≤4 mA

Potentiometer (coarse) for operating range adjustment

Potentiometer for fine adjustment of switch point value

Analog versions

Potentiometer for adjusting the 4 mA to the medium

Potentiometer for adjusting the span to 20 mA (not all applications may reach 20 mA)

Set-up – Operating and Display Functions

Processor MS96

6 LEDs for flow rate status indication:

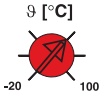
4 x green: degree of set point overrange (1, 2, 3, or 4 green LEDs are lit)

1 x yellow: flow is at/above set point
1 x red: flow is below set point

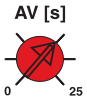
Potentiometer (coarse) for operating range adjustment

Potentiometer for fine adjustment of switch point value

Red LED illuminates when flow is at or above preset temperature



Potentiometer for temperature set-point adjustment (from -20°C to +100°C)



Potentiometer to set switch-off delay time which affects the flow monitoring output (terminals 6 - 8)

Self Contained Inline

6 LEDs for flow rate status indication:

4 x green: degree of set point overrange (1, 2, 3, or 4 green LEDs are lit)

1 x yellow: flow is at/above set point
1 x red: flow is below set point

≥20 mA
>16 mA
>12 mA
>8 mA
>4 mA
≤4 mA

Potentiometer for adjustment of flow switch point

Analog versions

Potentiometer for adjusting the 4 mA to the medium

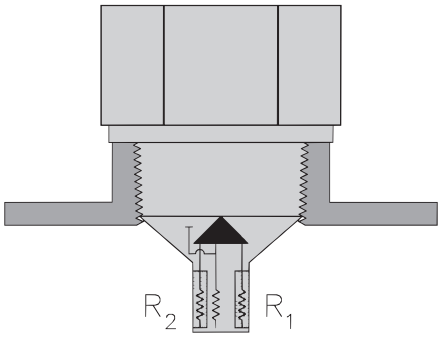
Potentiometer for adjusting the span to 20 mA
(not all applications may reach 20 mA)

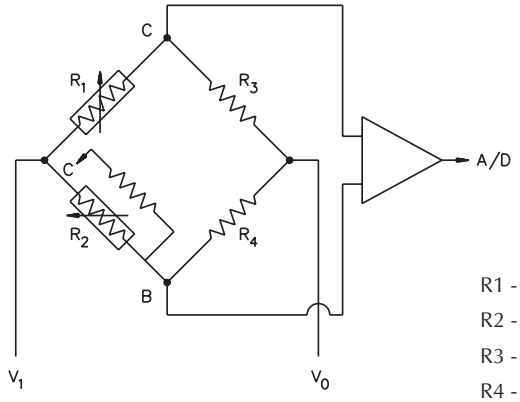
Principles of Operation

TURCK flow controls use no mechanical parts to monitor the flow speed of liquids and gasses. These solid state flow switches operate on the calorimetric principle: the measure of heat transfer from an object to a fluid.

The **TURCK** solid state flow monitors use two temperature dependent resistors similar to RTDs. One of the resistors (R1) monitors the temperature of the surrounding fluid. The other resistor (R2) is connected to a heating element. The heating element heats R2 to a temperature that is slightly above the surrounding fluid temperature. When there is no fluid flow, the difference in resistance between R1 and R2 is a fixed value. As fluid moves over the flow monitor probe, heat is conducted away from the heating element causing the temperature on R2 to decrease. This heat loss changes the difference in resistance between R1 and R2.

The resistance difference is measured by a Wheatstone bridge circuit. A change in resistance difference causes a change in the bridge voltage. The flow set point is determined by comparing the bridge voltage to a reference voltage.





R1 - Monitors fluid temperature
R2 - Heated by heating element
R3 - Internal resistor
R4 - Internal resistor

Operating Range

Heat loss on the heating element will likewise determine the sensitivity of the monitor. The heat loss becomes a function of flow velocity and thermal conductivity of the fluid. The lower the thermal conductivity of the fluid, the faster the fluid has to flow to be detected.

Flow monitor operating ranges vary from one type of fluid to the other. These operating ranges are proportional to the speed of the fluid that the monitor can detect.

At the same flow rate compared to water, air can conduct away from the heating element only a fraction of the heat. For example, for A2/A4 stainless steel insertion type monitors the operating range for air flow is from 2 to 30 m/s, and for water from 1 to 150 cm/s. For oil, the range is between the 3 to 300 cm/sec.

Temperature Gradient

The temperature gradient of a fluid indicates the change in fluid temperature within a specified time (unit of measure: °C (°F)/min). The temperature gradient of a device defines the maximum temperature rise that can be compensated by the monitor without malfunction.

The monitor has the ability to compensate for sudden thermal shifts within the specified extremes. Sudden temperature changes exceeding the specified tolerances (temperature error) may cause the device to malfunction. Only when the monitor has adapted to the new temperature, will it provide an accurate measurement.

The temperature gradient for **TURCK** flow controls is 250°C/min. - 15 times higher than standard flow devices which makes for a particularly accurate switch-point stability during variations in temperature.

The sensitivity to temperature rise of **TURCK** flow monitors has been reduced to a minimum (<12 s) and can accurately be determined in advance. This characteristic is the result of the optimum calorimetric principle and special monitors construction.

Time Delay Before Availability

The availability is the time required, after power has been applied, for the flow monitor to reach a stable operating condition. The availability provides for the time needed to energize the flow monitor and the time needed for the flow monitor to stabilize at the fluid's temperature.

Response Time

The switch on time is the time required for the flow monitor to detect and indicate that the flow speed is increasing. The switch off time is the time required for the flow monitor to detect and indicate that the flow speed is decreasing.

Effects of Housing Material

The switch on time, the switch off time and the temperature gradient of the flow monitor is dependent on the housing material. The Teflon ® flow monitors have a low thermal conductivity causing a slower response time to fluid temperature changes and to changes in the flow speed.

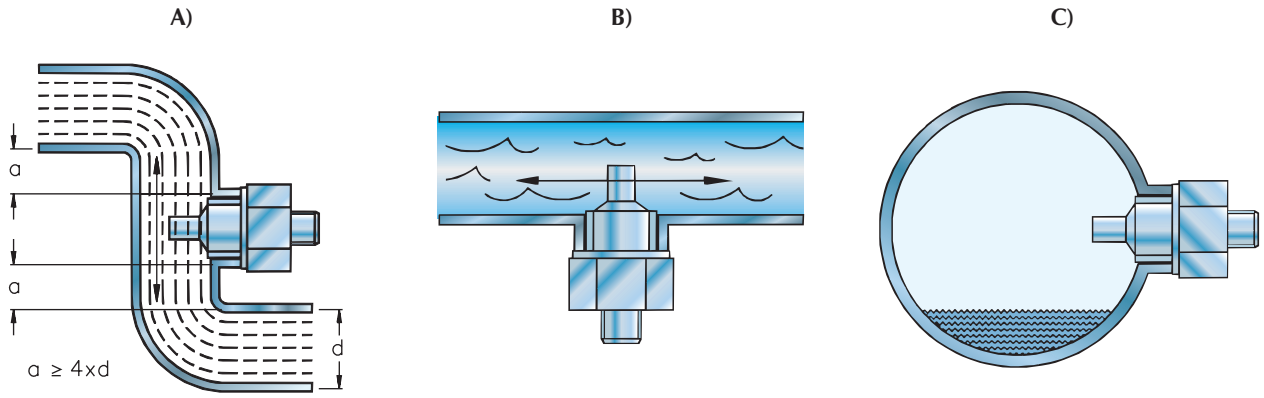
Mounting Instructions

Areas of turbulent flow occur whenever there is a change in the pipe construction (e.g. pipe inlets, pipe outlets, pipe elbows). To avoid an inaccurate output, the following guidelines should be observed:

A) Pay special attention to the minimum distance (a³4xd) to tube bend and intersections.

B) Flow monitor must be mounted from below in applications where medium does not completely fill the pipe.

C) If a possibility of deposit build-up exists, mount the flow monitor at the side of the pipe.



Proper Orientation for TURCK Flow Monitors

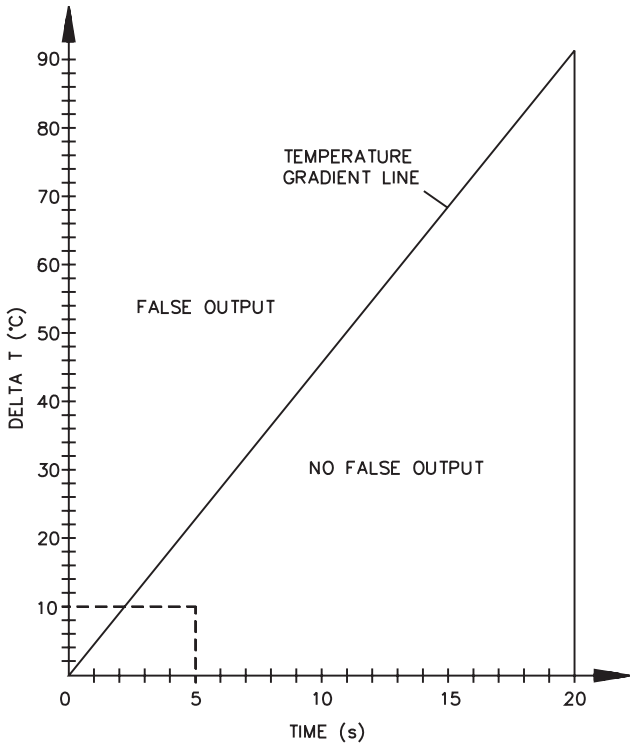
Response Time

Graph 1
Temperature Gradient for Stainless Steel Housing



Graph 1 can be used to determine if the **TURCK** flow monitor can compensate for a temperature change to a sensed medium. The dotted line in the graph indicates that a 10°C change has occurred in a time period of 5 seconds. Points (5,10) intersect in the "No False Output" region of the graph. This example illustrates an acceptable degree of temperature change in the application. As a result, the flow monitor can compensate for the fluid temperature change.

Fahrenheit = (1.8X°C) + 32

Flow Conversions

The calorimetric principle is dependent on the fluid speed, and not the volumetric flow rate.
On the following pages are conversion charts from flow speed to volumetric flow rate.

SCFM = 1.0737 X ID2 X FSM
GPM = 0.0803 X ID2 X FS
FT/S = 0.0328 X FS
FT/S = 3.2808 X FSM

GPM: Gallons per minute
FT/S: Feet per second
ID: Inner Diameter of pipe in inches
FS: Flow Speed of fluid in cm/s
FSM: Flow Speed of fluid in m/s

Pages	M97 - M98	M101 - M102

Precise, Reliable Temperature Sensors for Process Automation

Accurately determining temperature is one of the most important tasks in processing and manufacturing industries. Precision, reliability and interface flexibility are just some of the characteristics that make a great temperature sensor. **TURCK's** new TS400 and TS500 temperature sensor series provide all these traits and more, and adhere to the high standards consistent with all **TURCK** products.

TS400 and TS500 temperature sensors incorporate design elements that equate to real advantages in your applications. The TS400 and TS500 sensor series are platinum resistance temperature detectors (RTDs), commonly referred to as a Pt-100. Pt-100's are known to be highly precise, repeatable, and provide extremely short response times.

Pt-100's contain a platinum wire that is wrapped around a core or patterned as a thin film on a substrate so that it experiences minimal differential expansion or other strains. As the temperature changes, the controller measures the change in the electrical resistance of the platinum wire. Specifically, the hotter the wire becomes, the higher the value of electrical resistance. Pt-100 RTDs have a nominal resistance of 100 ohms at 0°C with an accuracy of 0.4°C at 50°C. The sensor's operating range varies from -50 to 500°C (-58 to 932°F).

Quality

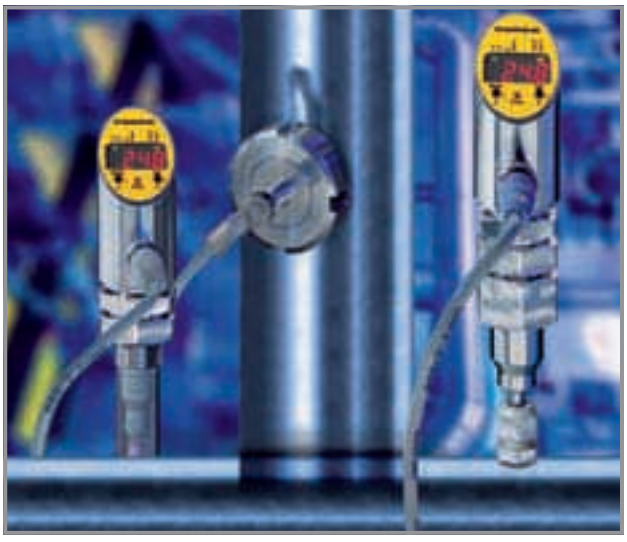
TS400 and TS500 sensors were designed to handle harsh manufacturing environments.

- High immunity to electromagnetic interference
- Reliable and accurate
- Compact design
- Robust stainless steel housing
- IP 67 environmental protection to increase operational durability

User-Friendly

TS400 and TS500 sensors were designed with the user in mind.

- Simple push-button programming
- Recessed button stores selected values and helps prevent unintentional operational errors
- The entire display can be inverted electronically
- The TS500 version can be rotated 320 degrees
- Does not require regular maintenance calibration
- M12 ***eurofast***® connection promotes easy integration in existing applications



Flexible

TS400 and TS500 use state of the art technology to bring you a sensor that facilitates operational efficiency.

- Remote or direct mountable
- Compact, robust housing
- 4-pin M12 ***eurofast***® connection
- Compatible with 4-wire probes
- Displays output in °C, °F, K and ohms

Benefits

TS400 and TS500 temperature sensors allow you to realize immediate benefits in your application.

- May be implemented in nearly all factory or process automation applications
- Housing design permits sensors to be mounted directly next to each other or in restrictive places
- Large, bright LED display
- Versions with multiple outputs available; all are easy to program and use

How to Order TS400 and TS500 Sensors and Accessories

1. Determine your desired output and select the TS model that meets your needs.
2. Select the appropriate probe for your application.
   a) Questions? Call 1-800-554-7769.
3. Choose remote or direct mounting.
   a) For direct mounting with TP 203 and TP 206, order the stabilizer (STA-3 or STA-6).
   b) For remote mounting, order a mating cordset (RK 4.4T-*-RS 4.4T).
4. Select a process connection.
   a) For thermowells, order one length shorter than the length of probe you selected in step 2.
   b) If no thermowell is selected, a compression fitting is needed for mounting the probe. (Note: The TP 104A does not require a process connection.)

* Length in meters.

TS400/TS500 Technical Data

Operating Voltage	15-30 VDC (switching outputs) 18-30 VDC (switching and analog output)
No-Load Current	≤50 mA
SELV. PELV	According to EN 50178
Short-Circuit Protection	Yes
Reverse Polarity Protection	Yes
Insulation Class	III
Switching Output	
Switching Frequency	≤180 Hz
Output Function	2 x PNP or NPN, N.C./N.O. programmable
Voltage Drop at I_e	≤2 V
Rated Operational Current	0.2 A
Switching Point Distance	0.2 K -49.8° to +500°C (-58° to +932°F)
Reset Points	-50° to +499.8°C (-58° to +932°F)
Analog Current Output	
Current Output	4-20 mA, 0-20 mA, 20-4 mA, 20-0 mA programmable
Response Time	<100 ms
Load	≥0.5 kΩ
Analog Voltage Output	
Voltage Output	0-10 V, 0-5 V, 1-6 V, 10-0 V, 5-0 V, 6-1 V programmable
Response Time	<100 ms
Load	≥2 kΩ
Temperature Sensor Accuracy	
Switching Output	
Switching Point Accuracy	≤ ± 0.2 K
Repetition Accuracy	≤ ± 0.1 K
Analog Output Accuracy (Lin.+Hys.+Rep.)	≤ ± 0.2 K
Temperature Sensor Housing	
Housing Material	Stainless steel/plastic 1.4404 (AISI 316L)/PC
Electrical Connection	Connector M12x1 (***eurofast***®), 4-pin with integrated high-speed connection technology.
Sensor Connection	Connector M12x1 (***eurofast***), 4-pin
Coupling Nut Size (with tightening torque)	SW 30 (max. 35 Nm)
Display	
Temperature Display	4-digit 7-segment display can be rotated by 180° and switched off
Switch State Display	2 x LED yellow
Measured Value/Programming	Switch/release points; hysteresis/window mode; N.O./N.C.; unit of display; peak value memory
Display of Temperature Unit	4 x LED green (°C, °F, K, Ω)
EMC	
EN 61000-4-2	ESD 4 kV CD / 8 kV AD
EN 61000-4-3	HF radiated: 15 V/m²
EN 61000-4-4	Burst 2 kV
EN 61000-4-5	Surge 1 kV, 42 Ω
EN 61000-4-6	HF conducted: 10 V
Ambient Conditions	
Medium Temperature	Directly connected -50° to 150°C (otherwise see temperature probes)
Ambient Temperature	-40° to +80°C (-40° to +176°F)
Storage Temperature	-40° to +80°C (-40° to +176°F)
Degree of Protection	IP 67
Vibration Resistance	20 g (10-2000 Hz) according to IEC 68-2-6

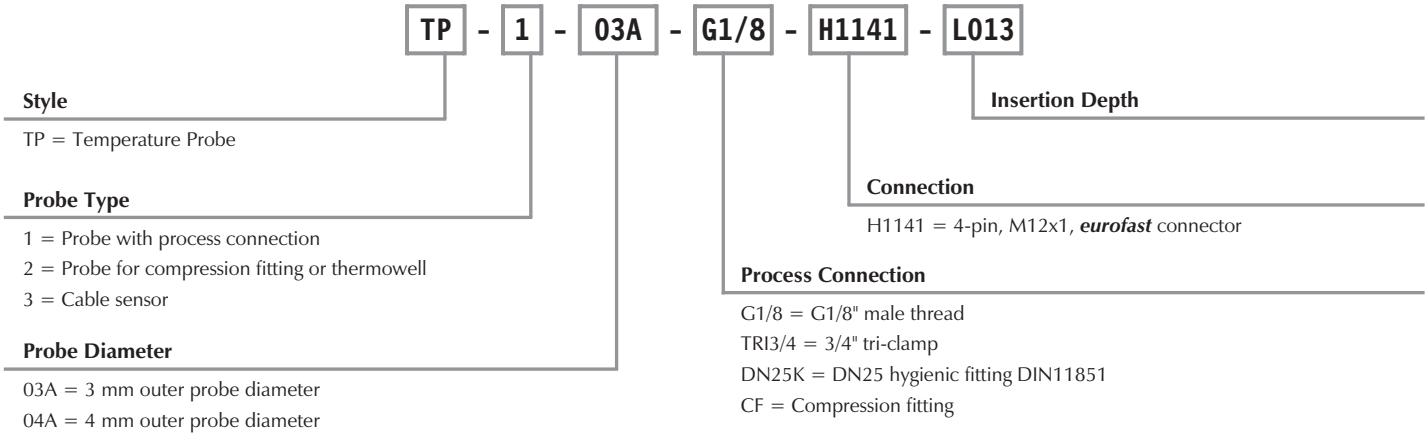
* Length in meters.

Simple Mounting

After the sensor is mounted, the actual processor unit is attached and fixed using a coupling nut. The sensor can still be rotated and aligned in all directions.

TS500 shown.

Temperature Probes Part Number Key



Temperature Probes Technical Data

Probe (TP-104A ..)

Temperature Operating Range	-50° to 120°C (-58° to +248°F)
Ambient Temperature	-20° to 90°C (-4° to +194°F)
Measuring Element	Pt100, DIN EN 60751, Class A
Response Time	$t_{0.5}$ = 3 s; $t_{0.9}$ = 10 s in water at 0.2 m/s
Output Function	4-wire
Reverse Polarity Protection	Yes
Degree of Protection	IP 67
Housing Material	Plastic/Stainless steel
Housing Quality	1.4404 (AISI 316L)
Sensor Material	Stainless steel
Sensor Quality	1.4404 (AISI 316L)
Pressure Rating (psi)	580.15
Connection	Connector, M12x1 (***eurofast***®)
Mechanical Connection	Tri-Clamp 3/4"; DN25 hygienic fitting according to DIN 11851

Temperature Probes Technical Data

Probe (TP-203 .. / TP-206 ..)

Temperature Operating Range	-30° to +500°C (-22° to 932°F) ≤350°C accuracy class A (662°F) ≥350°C accuracy class B (662°F)
Ambient Temperature	-20° to 90°C (-4° to +194°F)
Measuring Element	Pt100, DIN EN 60751, Class A
Response Time	203: $t_{0.5}$ = 1.5 s; $t_{0.9}$ = 6 s 206: $t_{0.5}$ = 6 s; $t_{0.9}$ = 15 s 306: $t_{0.5}$ = 8 s; $t_{0.9}$ = 20 s
Output Function	4-wire
Reverse Polarity Protection	Yes
Degree of Protection	IP 67
Housing Material	Stainless steel/plastic
Housing Quality	1.4404 (AISI 316L) mineral insulated
Sensor Material	Stainless steel
Sensor Quality	1.4404 (AISI 316L)
Pressure Rating (psi)	1450.38
Connection	Connector, M12x1 (***eurofast***®)
Mechanical Connection	For compression fittings or thermowells

---

Probe (TP-306A ..)

Temperature Operating Range	-50° to +105°C (-58° to +221°F)
Ambient Temperature	-20° to +90°C (-4° to +194°F)
Measuring Element	Pt100, DIN EN 60751, Class A
Response Time	$t_{0.5}$ = 8 s; $t_{0.9}$ = 20 s in water at 0.2 m/s
Output Function	4-wire
Reverse Polarity Protection	Yes
Degree of Protection	IP 67
Housing Material	Plastic/Stainless steel
Housing Quality	TPE (thermoplastic elastomer)
Sensor Material	Stainless steel
Sensor Quality	1.4404 (AISI 316L)
Pressure Rating (psi)	217.56
Connection	Connector, M12x1 (***eurofast***)
Mechanical Connection	For compression fittings or thermowells or for direct mounting

Self-Contained Temperature Monitors

The **TURCK** temperature monitor with digital readout is a fully programmable device that is easy to set up for a wide variety of applications. The self-contained temperature-monitoring device has two independently adjustable switching points or a single switch point with a separate analog output. The monitor can be used for limit-value monitoring or window functions. The TC01 sensor has an adjustable hysteresis, and can also be programmed to measure temperature in degrees Fahrenheit or degrees Celsius. These devices feature a highly visible digital display and a sensor housing that can be rotated to allow the viewing of temperature data from any direction. The 24 VDC devices include integral circuitry that protects against Short-Circuit damage, and a G1/2 threaded fitting for easy installation. They operate in temperatures from -40° to +120°C (-40° to +248°F).

Principles of Operation

The temperature sensors employ a calorimetric principle to provide continuous and accurate temperature analysis of liquid or paste-like media. They are ideal for temperature analysis in many industries including automotive, welding, hydraulic power units, beverage/brewery, plastics, pumps, pulp/paper, and semiconductor.

Operating Modes

If an over-range of a certain temperature is to be monitored, select the Hysteresis-function. In this mode, a limit value must be set. If the temperature exceeds this value, the output either activates or de-activates, depending on the selected output function. A Hysteresis value is assigned to the limit value, which determines the differential between the switch-on or switch-off value. It is also possible to delay the switch-on and switch-off times. If the window-function is selected as the operating mode, the switching output activates when the adjusted limit temperature is reached (beginning of window range) and de-activates when the end value (defined by the window width value) is reached. The switch-on and switch-off delay may also be used in this operating mode.

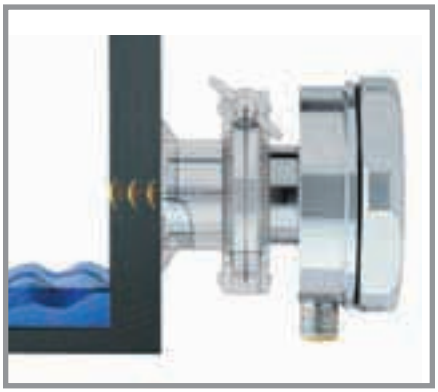
levelprox ®

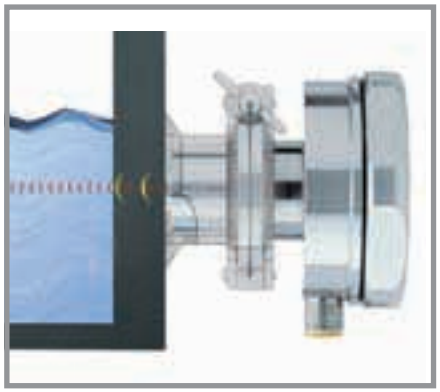
levelprox is a unique, non-invasive ultrasonic sensing solution that provides accurate media detection through metal container walls. ***levelprox*** mounts to the outside of a container with no compromise to structural integrity, and is ideal for high pressure, hazardous or sterile applications.

All it takes to reliably detect the presence of liquid through a metal container is to program the empty and full conditions into the ***levelprox*** using a simple teach button. The sensor generates a high frequency ultrasonic pulse that is transferred into the container wall through a coupling gel. As the pulse enters the container wall it is influenced by the containers contents. ***levelprox*** analyzes this pulse and compares it to the conditions that were programmed into the memory of the sensor.

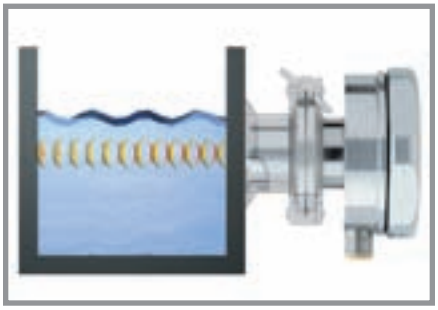
With Dual Operating Modes, *levelprox* Provides Reliable Detection in Even the Toughest Applications:

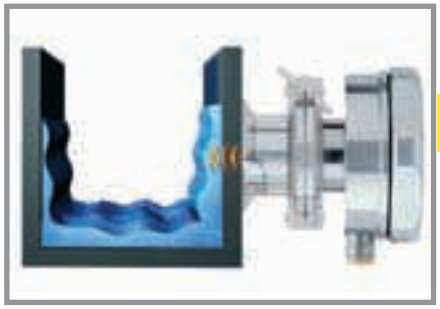
Reverb Mode: evaluates the ultrasonic pulse as it reverberates within the container wall. This pulse travels through the container wall until it reaches the inner wall. The reverb mode works great when the liquid to be detected has a low viscosity, leaving little or no coating on the container wall. The reverb mode should also be utilized when stirring devices are used inside the container.





Echo mode: evaluates the ultrasonic pulse as it travels through the liquid and echoes off of the opposite container wall. Highly viscous liquids can be reliably detected with the echo mode. The mode looks past the layers of product that can coat the inside of a container to give the true level of the product.





Dual Mode T50

levelprox ®

The T50 dual-mode ***levelprox*** features a robust 316L stainless steel housing with an integrated sanitary connection. The sensors construction and non-invasive operation make it the perfect choice for applications in food, beverage and pharmaceutical industries. The integrated Tri-Clamp mounting flange maintains proper orientation to the tank wall and also protects the coupling during washdown operations.

Dual Mode M30

The M30 dual-mode ***levelprox*** is ideal for level detection applications where stainless steel sanitary fittings are not required. The M30 delivers non-invasive detection without the additional expense of a sanitary housing. Its 30 mm barrel can be easily mounted using a welding adapter or a metal strap kit.

Mounting Accessories

Mounting accessories are available for the T50 and M30 sensors for welding, bonding and strapping ***levelprox*** sensors to most common containers.

Recommended Operating Mode

Application	Reverb	Echo
Liquids contaminated with solids	Yes	No
Liquids that leave a film on container wall	No	Yes
Liquid with internal mixing devices	Yes	No
Containers with internal coating	No	Yes
Containers greater than 6 ft. across	Yes	No
Aerated liquid	Yes	No

Switching status indication . . . . . Yellow LED
Error Indication . . . . . Red LED flashing and alarm output on
Alarm Indication . . . . . Red LED
Flashing Green LED indicates alarm off
Approvals . . . . . Class I, Division 2

Mounting the T50 *levelprox*®

Mounting

One of the most critical procedures in any ***levelprox*** application is the mounting of the sensor. Reliable operation of the sensor requires a mount that is rigidly fixed and properly oriented to the container wall. Below you will find some important tips for mounting a ***levelprox***.

Surface Preparation

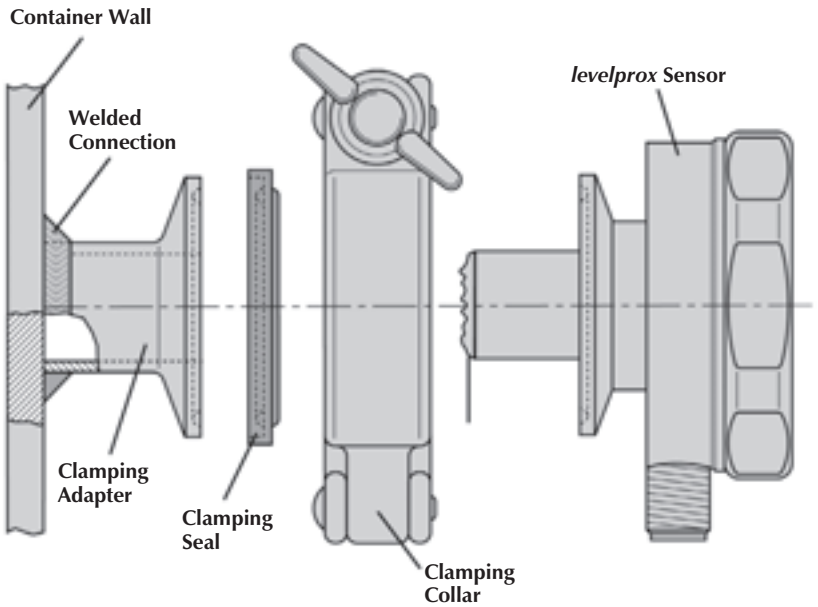
The surface of the tank plays an important role ensuring proper operation of the sensor. The surface finish and structural integrity of the container wall need to be evaluated when selecting a mounting location for the sensor. The surface finish should be smooth and free of rust, paint, and coatings that could affect the sound transmission of the sensor. The area of the tank where the sensor will mount should be in good condition, i.e. no pitting, dents, welded joints, internal structures etc. If you are using a weld-on mount, be aware that excessive heat from the welder can distort thin walled containers.

Mounting the Sensor

The ***levelprox*** needs to make solid contact with the container wall for proper operation. Ideally the clamping adapter should be mounted perpendicular to the container wall. In the case of a round container, the sensor should be mounted so that the transducer is pointing at the center axis. **TURCK** offers several mounting options designed to keep the sensor optimally coupled with the wall of the container.

Installation

Included with every **TURCK** ***levelprox*** is a small container of coupling gel. This gel is required for the sensor to efficiently pass the ultrasonic pulses into the container wall. Before installing the sensor on the container, remember to apply a generous amount of the gel to the sensors transducer surface.



Housing Style	Part Number	ID Number	Container Wall Thickness	Min\Max Container Diameter	Programming	Output

Mounting Accessories for T50

Part Number	ID Number	T50 Weld Kit
LP-MS-T50-S	M6900253	

Designed to mount the T50 sensor to flat sided containers. Can also be used for mounting to large diameter round containers.

Includes: Clamping Adapter, Clamp, and Gasket

Part Number	ID Number	T50 Epoxy Mounting Kit
LP-MS-T50-K	M6900255	

Designed for mounting the T50 sensor to flat sided containers. Kit is ideal for applications where welding is not possible.

Includes:
Clamping Adapter, General Purpose Epoxy, Clamp, Gasket, and Locator Buttons

Part Number	Clamping Adapter
LP-Clamping Adapter-*	

Custom machined weld-on clamping adapter to fit round containers.

Note: Clamp and gasket need to be purchased separately, see table on right.

* Indicates the container diameter in meters.

Mounting Accessories for M30

Part Number	ID Number	Push Button
VB2-SP1	A3501-29	

The VB2-SP1 is used for programming and mode selection of the M30 ***levelprox***

Part Number	ID Number	M30 Weld Mount
LP-MZ-M30-SB	A5321	

Mounting Bracket can be strapped or welded to container. Perfect for applications that don't require washdown.

Part Number	ID Number	M30 Sanitary Adapter
LP-MZ-M30-T50	A5317	

Allows the M30 to be mounted using T50 Accessories. Use with **LP-Clamping Adapter-*** in applications that are subjected to washdown.

* Indicates the container diameter in meters.

Part Number	ID Number	M30 Straps
LP-MZ-M30-B250	A5320	
LP-MZ-M30-B500	A5319	
LP-MZ-M30-B1000	A5322	

Use with LP-MZ-M30-SB to mount the M30 using straps. Constructed of stainless steel with lengths available:
250 cm, 500 cm, and 1000 cm

Includes:
Two stainless steel straps

** Accessories that can also be used on M30 style ***levelprox***.

EZ-track® Liquid Level Probe

The ***EZ-track*** line from **TURCK** is a line of magnetostrictive linear displacement transducers. These devices detect the position of an external magnet along the active stroke of the sensor without causing any wear on the sensor parts. Because there are no parts to wear or break, the sensors can offer better performance over a longer life than competing technologies. They also offer an alternative when a continuous, absolute reading is necessary in the application.

The ***EZ-track*** R16 Liquid Level Sensor is a programmable, two-wire loop powered intrinsically safe probe that is ideal for continuous level monitoring in a variety of liquids and tank designs. The R16 sensor uses magnetostrictive technology to monitor the position of a magnetic float along the active stroke of the sensing tube, which is then converted into a configurable 4-20 mA output. The IP 68 rated R16 liquid level sensors are available in a rigid 316 stainless steel housing or a flexible PVDF design. The probe lengths vary between 18 and 288 inches. The stainless steel version is also available in an optional Food Grade or 3A Rated Sanitary finish probe for use in an array of food service, dairy and beverage applications. A variety of floats, fittings, and accessories are available to fit virtually any application requirement.

All of the electronics for the R16 sensor are incorporated within the 5/8 inch sensing rod, which eliminates the need for an electronics enclosure at the top of the sensor. This feature when ordered with the standard 4-pin ***minifast***® quick disconnect, offers greater mounting options, and a faster, more reliable installation. The R16 liquid level sensor has a resolution of 0.02 inches of full scale, and an accuracy of 0.1% over the programmable monitoring span, making it the ideal sensor for applications where continuous level position is required.

Conductive Level Probes and Controllers

TURCK offers liquid level probes for use in conjunction with our Level control Monitors to provide a simple solution for liquid level applications. The resistance between the terminals is measured to determine the level of the medium in the tank.

Level Controllers

The level control logic is built in to the controller which offers a variety of options to fit any application.

- Adjustable Sensitivity
- Single Set-points
- Multiple Inputs
- On/Off Delay
- Programmable Outputs

These devices can be used in applications to control the filling and draining of a tank or as high and low level alarms. The level controller is able to differentiate between a variety of liquids, as well as distinguishing between liquid and foam. Many of the monitors have adjustable on and off-delays for use in turbulent liquid level applications, as well as the necessary logic to control overflow monitoring.

Level Probes and Probe Holders

TURCK also offers stainless steel probes, and stainless steel holders with ceramic insulators. The probes are used to provide single-point level control, while the holders are sealed to withstand applications up to 2500 psi at +70°F (+21°C). These parts provide reliable liquid level control in a wide variety of applications.

MK91-121-R.. and MK91-12-R.. Specifications

Galvanic Isolation	between input, output and supply circuits, test voltage 2.5 kVrms
Probe Voltage	0.02-5 V_{PP}/150 Hz (delta)
Sensitivity Ranges (Switching Thresholds)	
- Range 1	0.2-1 kΩ
- Range 2	0.8-4 kΩ
- Range 3	2.5-15 kΩ
- Range 4	10-100 kΩ
Hysteresis	approx. 10%
Switch-on Delay	0-20 s (adj.)
Switch-off Delay	0-20 s (adj.)
Contact Material	silver alloy + 3 µ Au
Switching Capacity	≤500 VA / 60 W
Protection	IP 20
Mounting	DIN 50022 or pull-out tabs
Operating Temperature	-25° to +60°C (-13° to +140°F)
Line Frequency (AC)	48-62 Hz
Ripple (DC)	≤10%

MK91-R11.. Specifications

Galvanic Isolation	between input and output circuit, insulation test voltage 4 kV/8 mm input circuit and supply voltage galvanically connected
Switching Point Deviation in Supply Voltage Range	≤1%
Operating Characteristics at:	V = 24 V, R_M = 40 k
- Rectangular Signal	f = 1 Hz
- Amplitude of Electrode Voltage	±2 V
- Amplitude of Electrode Current	±50 µA
Contact Material	silver alloy + 3µ Au
Switching Capacity	≤500 VA / 60 W
Protection	IP 20
Mounting	DIN 50022 or pull-out tabs
Operating Temperature	-25° to +60°C (-13° to +140°F)
Line Frequency (AC)	48-62 Hz
Ripple (DC)	≤10%

MS91-12-R.. Specifications

Galvanic Isolation	between input, output and supply circuits
Probe Voltage	typ. 5 V_{PP}/100 Hz (delta)
Sensitivity Ranges (Switching Thresholds)	
- Range 1	0.1-1 kΩ
- Range 2	0.5-5 kΩ
- Range 3	2-20 kΩ
- Range 4	10-100 kΩ
Hysteresis	10%
Switch-on /Switch-off Delay	0.1-15 s (adj.
Contact Material	AgCdO
Switching Capacity	≤500 Va/60 W
Protection	IP 20
Mounting	DIN 50022 or pull-out tabs
Operating Temperature	-25° to +60°C (-13° to +140°F)
Line Frequency (AC)	48-62 Hz
Ripple (DC)	≤10%

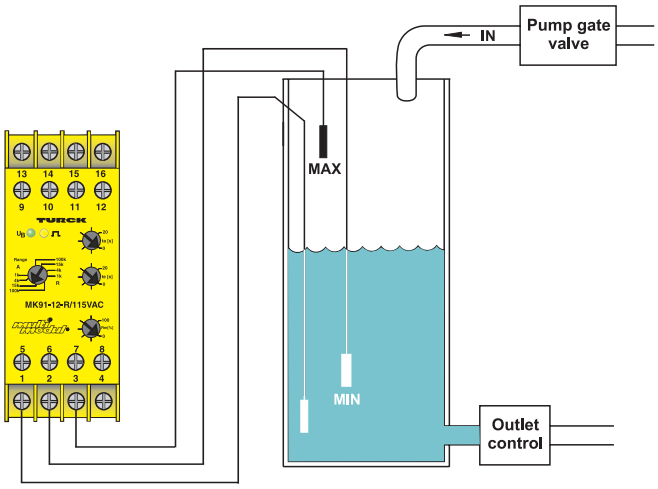
Level Detection Application Examples

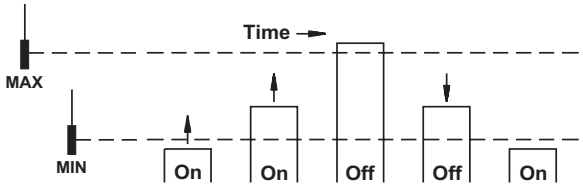
Control for Pump-in "Filling" a Tank



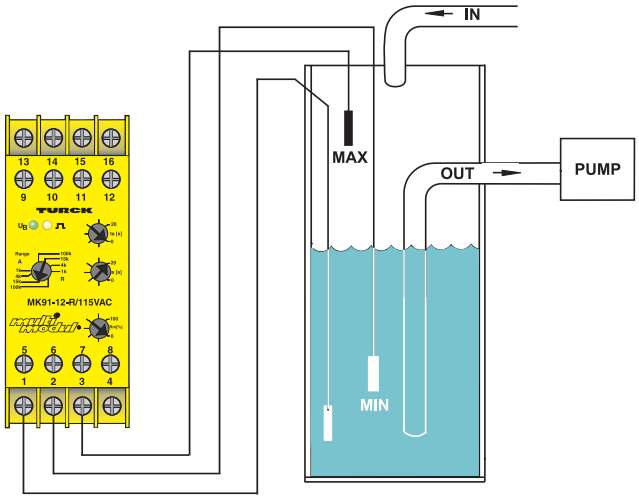
Example Application using MK91-12-R/...

The MK91-12-R will start a pump or open a fill valve when the liquid drops below the MIN level probe and will remain on until the MAX level probe is reached.

The relay then de-energizes and stays off until the MIN level is reached. The pump or valve does not cycle constantly, as would be the case if only one sensor were used.



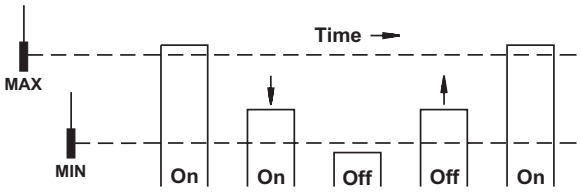
Control for Pump-out "Draining" a Tank



Example Application using MK91-12-R/...

The MK91-12-R will start a pump when the liquid reaches the MAX level probe and remain on until the MIN level probe is reached.

The relay then de-energizes and stays off until the MAX level is reached. The pump or valve does not cycle constantly, as would be the case if only one sensor were used.



Notes:

Glossary

Abrasion Resistance
Ability of wire, cable or material to resist surface wear.

ABS
American Bureau of Shipping. Establishes and administers standards for the design, construction, and operational maintenance of marine vessels and structures.

AC Alternating Current
Current in which the charge-flow periodically reverses and is represented by: I = I0cos (2 f + f) [I= Im cos (vt+f] where I is the current, I0 is the amplitude, f the frequency, f the phase angle.

Active Hub
A multiple port repeater or amplifier that lengthens the branching ability of a bus.

Address
A unique logical point on the bus.

Ambient Temperature
The temperature of a medium (gas or liquid) surrounding an object.

Ampere (A)
The unit of current. One ampere is the current flowing through one ohm of resistance at one volt potential.

Amplifier
A product that strengthens a signal in real time, precisely copying the old signal. Links two portions of the same bus together when the signal is weakened by electrical losses as it travels down a wire. An amplifier is used when the signal is weak, but not distorted.

Analog I/O
Variable 2-wire continuous low level current or voltage signal.

ANSI
Abbreviation for American National Standards Institute.

Armored Cable
A cable provided with a wrapping of metal for mechanical protection.

armorfast®
TURCK's brand name for a cordset with metal clad cable
(NEC type MC)

AWG (American Wire Gauge)
The standard system used for designating wire diameter. The lower the AWG number, the larger the diameter. Also called the Brown and Sharpe (B&S) wire gauge.

AWM (Appliance Wiring Material)
A UL designation covering insulated wire and cable for internal wiring of appliances and equipment.

Axial Approach
The approach of the target with its center maintained on the sensor reference axis.

Axially Polarized Ring Magnet
A ring magnet whose poles are the two flat sides of the disk. Mounted on pistons for ***permaprox®*** cylinder position sensing through nonmagnetic cylinder walls.

BA - Bitwise Arbitration
A form of collision detection on a network. All senders must also be receivers. Bus line must be a specific length or less so all nodes hear the bit at the same time.

Barrier Box
Limits current voltage to an area.

Binder
A spirally served tape or thread used for holding assembled cable components in place awaiting subsequent manufacturing operations.

Bit Encoding
A time reference placed on an electrical or light signal to distinguish high and low bits.

Bit
One piece of data that means either 'High-Low' or 'ON-OFF'.

Braid
A fibrous or metallic group of filaments interwoven in cylindrical form to form a covering over one or more wires.

Branch
One type is a double-sided node that connects two connects two a segments together that are the same protocol but different transmission speeds. The other is a smart repeater that only repeats the data between two bus segments when the source and destination are in different protocols.

Bus Junction
TURCK's designation for a Connectorized passive hub.

Bus Module
TURCK's designation for any field node, whether it uses terminal screws, connectors, or a combination of connecting means.

Bus Occupant
Any active or passive device on a network.

Bus Station
TURCK's designation for a fully Connectorized field node, but not a master or gateway.

Bus
A simple straight-line topology.

Busline
Any group of wires that carries data from node to node.

Byte
8 bits of information.

Cable
A stranded conductor with or without insulation and other coverings (single-conductor cable), or a combination of conductors (multiple-conductor cable).

Capacitive Proximity Sensor
A proximity sensor producing an electrostatic field that senses conductive targets and nonconductive materials having a dielectric constant of >1 within its sensing zone.

Carrier
The bit encoded signal carrying the data can ride on top of an AC or DC carrier. Advantages to using a carrier are that both power and data can be sent on just 2 wires and longer transmission capabilities without distortion.

CD - Collision Detection
A form of collision detection on a network. All senders must also be receivers. If two nodes start talking at the same time they will hear a collision. Both stop talking, wait a random amount of time, then look for a clear line to start talking again.

Checksum
A numerical representation of all the bits that is prepared by the sender and included in the message. The receiver performs the same calculation and compares the results. If they are not equal the data is considered bad and not used.

Client/Server
Upload/download information, set point changes, alarm management, remote diagnostics and one-to-one communications.

Color Code
Wire or circuit identification by color, utilizing solid colors, tracers, braids, surface printing, etc.

Complementary Output
Two outputs, one N.O. and one N.C., that can be used simultaneously. ***The sum of both load currents cannot exceed the sensor's rated Continuous Load Current***.

Conductivity
The ability of a material to allow electrons to flow, measured by the current per unit of voltage applied. It is the reciprocal of resistivity.

Conductor
A wire (or combination of wires not insulated from one another) suitable for carrying electric current.

Conduit
A tube or trough in which insulated wires and cables are run.

Connector
A device used to provide rapid connect / disconnect service for electrical cable and wire terminations.

Contact Holder
Insulating device that holds the contacts in their proper position

Contact
The parts of a connector that actually carry the electrical current and that are touched together or separated to control the flow.

Continuous Load Current
The maximum current allowed to continuously flow through the sensor output in the ON state.

Cord
A small, flexible insulated cable.

Cordset
Portable cord fitted with a wiring device at one or both ends.

Correction Factors
Percentage of the rated operating distance (Sn) that represents the operating distance for targets constructed from materials other than mild steel (mild steel's correction factor is 1.0).

CPE (Chlorinated Polyethylene)
A flexible material with high tear strength and good resistance to most inorganic chemicals. It is inherently difficult to ignite. A Thermoset plastic.

Creepage
The conduction of electricity across the surface of a dielectric.

Crimp Termination
A connection in which a metal sleeve is secured to a conductor by mechanically crimping the sleeve with pliers, presses or automated crimping machines.

Current (I)
The rate of transfer of electricity. Practical unit is the ampere, which represents the transfer of one coulomb per second. In a simple circuit, current (I) produced by a cell or electromotive force (E) when there is an external resistance (R) and internal resistance (r) is: I = E / R + r)

Current Carrying Capacity
The maximum current an insulated conductor can safely carry without exceeding its insulation and jacket temperature limitations.

Cut-Through Resistance
The ability of a material to withstand mechanical pressure, usually a sharp edge or small bending radius, without separation.

Dielectric Strength
The voltage that an insulator can withstand before breakdown occurs. Usually expressed as a voltage gradient (such as volts per mil).

Differential Travel (Hysteresis)
The difference between the operating point as the target approaches the sensor face, and the release point as the target moves away. Given as a percentage of the operating distance (Sn).

Direct Current (DC)
An electric current that flows in only one direction.

Glossary

Discrete I/O
Signaling where the supply is typically switched to designate a change ofstate.

DNV
Det Norske Veritas. Management system certification body.

Drain Wire
In a cable, the bare wire laid over the component or components and used as a ground connection.

Dropline
A reduced branch (spur) from a trunk line.

Dynamic Output
A sensor output that stays energized for a set duration of time, independent of the time the target is present (one-shot).

Earth
British terminology for zero-reference ground.

EDS - Electronic Data Sheet
Electronically readable ASCII text files that contain both general and device-specific parameters for communication and network configuration (DeviceNet™).

EIA RS-485
A standard that defines the number of signal generators (the components that create the signal), the receiver and a combination of the called a transceiver. It also defines the electrical signal.

Embeddable (Shielded) Proximity Sensor
A sensor that can be flush-mounted in any material without that material influencing the sensing characteristics.

End of Message
Lets other occupants of the bus know the transmission is over and other messages can be sent.

EPDM
Ethylene-propylene-diene monomer rubber. A material with good electrical insulating properties. A Thermoset plastic.

eurofast ®
M12x1 threads, single key, 2 - 6, 8, 10, 12-pin

Explicit Message
A command from another node.

Exposed Run/Direct Burial
Cable construction meeting the crush and impact requirements of metal clad cables without metal clad. For use as exposed wiring between cable tray and equipment.

extremelife™
Heavy duty cable for extreme temperature environments. These cables provide excellent resistance to extreme cold temperatures and oilfield drilling muds.

Extruded Cable
Cable with conductors that are uniformly insulated and formed by applying a homogeneous insulation material in a continuous extrusion process.

Fillers
Non-conducting components cabled with the insulated conductors or optical fibers to impart roundness, flexibility, tensile strength, or a combination of all three, to the cable.

firefast ®
High temperature protective sleeving.

FKS - Frequency Shift Key
A common bit encoding method for modulated signals.

flexlife-10 ®
Unique cable designed for robotic and other continuous motion applications.

Free Zone
The space around a proximity sensor that must be kept free of any material capable of affecting the sensing characteristics.

Gateway
A node on two different buses that serves as a signal and data translator between the buses.

Ground Loop
A completed circuit between shielded pairs of a multiple pair created by random contact between shields. An undesirable circuit condition in which interference is created by ground currents when grounds are connected at more than one point.

Ground Potential
The potential of the earth. A circuit, terminal or chassis is said to be at ground potential when it is used as a reference point for other potentials in the system.

Ground
An electrical connection to the earth, generally through a ground rod. Also a common return to a point of zero potential, such as the metal chassis of equipment.

GSD - General Station Description
Electronically readable ASCII text files that contain both general and device-specific parameters for communication and network configuration (PROFIBUS).

HART
Two-way digital communication protocol for process measurement.

Hygroscopic
Capable of absorbing moisture from the air.

IEC
European Standardization agency; International Electrotechnical Commission.

IEEE
Institute of Electrical and Electronics Engineers

Inductive Magnet Operated Sensor (*permaprox* ®**)**
A solid-state sensor consisting of a sensing element susceptible to magnetic field strengths of 20-350 Gauss, and switching circuitry similar to that of an inductive proximity sensor.

Inductive Proximity Sensor
A proximity sensor producing an electromagnetic field that senses only metal targets within its sensing zone.

Input
A signal (or power) which is applied to a piece of electrical apparatus or the terminals on the apparatus to which a signal or power is applied.

Inrush Current
The maximum short-term load current that the output of a sensor can tolerate.

Insulation
A material having good dielectric properties that is used to separate close electrical components, such as cable conductors and circuit components.

IP Rating
Ingress Protection rating per IEC 529.

Irradiation
In insulation, the exposure of the material to high-energy emissions for the purpose of favorably altering the molecular structure.

ITC
Instrument Tray Cable. NEC classification for cable resistant to the spread of fire and suitable for use in cable trays. 150 V rating.

Jacket
Pertaining to wire and cable, the outer protective covering, may also provide additional insulation.

LAS - Link Active Scheduler
Controls communication on the bus. Creates a token circulation list that defines access on the bus. Multiple devices may have LAS but only one can communicate at a time.

Lateral Approach
The approach of a target perpendicular to the sensor reference axis.

LED
Light Emitting Diode used to indicate device status.

Limited Peer-to-Peer
An exclusive one-to-one relationship between the input node and the output node. Also called exclusive peer-to-peer.

Line Voltage
The value of the potential existing on a supply or power line.

Load
A device that consumes power from a source and uses that power to perform a function.

lokfast™ **Guard**
Guards for minifast and eurofast connections in hazardous locations. The guard requires a tool to remove.

M Threading
ISO 68 Metric straight threading, designated as "Nominal Size" X "Pitch", in mm. (Ex. M5X0.5)

Manchester
A common bit encoding for digital signals.

MC
Metal Clad Cable. NEC classification for cable resistant to crush and impact based on an outer covering of metal.

Media Access
The "right-of-way" for talking on the bus.

Message Collision Avoidance
A process for eliminating communication collisions on a network. The two major ways to handle a potential collision are CD (Collision Detection) and BA (Bitwise Arbitration).

Messaging
Ways to communicate on the network. The three major types in the run mode are Solicited, Unsolicited and Explicit.

microfast ®
½"-20UNF threads, dual key, 2 - 6-pin

microfast ®
½"-20UNF threads, dual key, 2 - 6 pin

minifast ®
7/8"-16UN threads, 2 - 6-pin

minifast **B size**
1"-16UN threads, 6 - 8 pin

minifast **C size**
1 1/8"-16UN threads, 9, 10, 12-pin

Minimum Load Current
The minimum amount of current that is required by the sensor for reliable operation.

Moisture Resistance
The ability of a material to resist absorbing moisture from the air or from water when immersed.

Molded Plug
A connector molded onto either end of a cord or cable.

MOV
Acronym for Metal Oxide Varistor. A solid state device used to suppress voltage surges \ spikes

MSHA
Mine Safety and Health Administration

multibox ®
Junction boxes, 4, 6, 8 and 16 port

Glossary

multifast
M23x1 threads, 12, 16 and 19-pin or M27 threads, 26 and 28-pin

Mylar
DuPont trademark for polyester film.

NAMUR Sensor
A 2-wire variable-resistance DC sensor whose operating characteristics conform to DIN 19 234. Requires a remote amplifier for operation. Typically used for intrinsically safe applications.

NAMUR
The acronym for a European standards organization.

National Electrical Code (NEC)
A set of regulations governing construction and installation of electrical wiring and apparatus in the United States, established by the American National Board of Fire Underwriters.

NEMA Rating
An enclosure rating per NEMA Standard 250.

NEMA
National Electrical Manufacturers Association.

Neoprene
A synthetic rubber with good resistance to oil, chemical, and flame. Also called polychloroprene. A Thermoset plastic.

Node
An addressable device on the bus.

Noise
In a cable or circuit, any extraneous signal that tends to interfere with the signal normally present in or passing through the system.

No-Load Current
The current drawn by a DC proximity sensor from the power supply when the outputs are not connected to a load.

Nonembeddable (Nonshielded) Proximity Sensor
A sensor is nonembeddable when a specified free zone must be maintained around its sensing face in order not to influence the sensing characteristics.

Normally Closed (N.C.)
The output is OFF when the target is detected by the sensor.

Normally Open (N.O.)
The output is ON when the target is detected by the sensor.

NPN Output (Current Sinking)
A transistor output that switches the common or negative voltage to the load. Load is between sensor and positive supply voltage.

NPN Output
Transistor output that switches the common or negative voltage to the load (current sinking). Load connected between output and positive supply.

NPSM Threading
American National Standard Straight Pipe Thread for Free-Fitting Mechanical Parts.

NPT Threading
American National Standard Taper Pipe Thread.

NRZ - Non Return to Zero
An encoding method on differential signals such as RS-485 and CANbus.

Off-State (Leakage) Current
The current that flows through the load circuit when the sensor is in the OFF-state. Also known as leakage or residual current.

Ohm (Ω)
The electrical unit of resistance. The value of resistance through which a potential difference of one volt will maintain a current of one ampere.

Ohm's Law
E = I x R. Voltage (E) is directly proportional to the product of current (I) and resistance (R) of circuit.

Operating Distance
A distance at which the target approaching the sensing face along the reference axis causes the output signal to change.

Output
The useful power or signal delivered by a circuit or device.

Overload Protection
The ability of a sensor to withstand load currents between continuous load rating and short-circuit condition with
no damage.

PA (Polyamide, Nylon)
An abrasion-resistant thermoplastic with good chemical resistance, also known as polyamide.

Passive Hub
A multi-port tee.

pentafast ®
M5 threads, 3 and 4-pin

PG Threading
Steel conduit threading per German standard DIN 40 430.

picofast ®
Snap lock or M8x1 threads, 3, 4 and 6-pin

Plastic
High-polymeric substances, including both natural and synthetic products, but excluding the rubbers, that are capable of flowing under heat and pressure.

PLTC
Power Limited Tray Cable. NEC classification for cable resistant to the spread of fire and suitable for use in cable trays. 300 V rating.

Plug
A connector associated with being attached to a cable.

PNP Output (Current Sourcing)
Transistor output that switches the positive voltage to the load. Load is between sensor and common.

PNP Output
Transistor output that switches the positive voltage to the load (current sourcing). Load connected between output and common.

POM (Polyoxymethylene, Acetal, Delrin)
Polyoxymethylene - a crystalline thermoplastic polymer with a high melting point. It is suitable for mechanical parts or electrical insulators that require structural strength at above normal temperatures.

Potting
The sealing of a cable termination or other component with a liquid that thermosets into an elastomer.

Power Conditioner
Device used to condition the power to be used for a bus segment. Allows power and data to exist on the same wires.

Power Tap
A tee which provides power to the network.

powerfast ®
1 3/8"-16 threads, 2, 3 and 4 pin or M23 threads, 6, 7 and 9 pins.

Programmable Output
Sensor output whose N.O. or N.C. function can be selected by means of a jumper or specific terminal connection.

Protocol
A small program that is embedded in sending and listening devices to organize the meaning of bits. DeviceNet, AS-interface, PROFIBUS, Ethernet, etc. are all examples of different protocols.

Publisher / Subscriber
Scheduled distribution of data to nodes on the subscriber list.

PUR (Polyurethane)
Broad class of polymers noted for good abrasion and solvent resistance.

PVC (Polyvinyl Chloride)
A general-purpose thermoplastic widely used for wire and cable insulation and jackets.

Radially Polarized Ring Magnet
A ring magnet whose poles are the inner and outer diameter rings.

Rated Operating Distance (Sn)
A conventional quantity used to designate the operating distance. It does not take into account either manufacturing tolerances or variations due to external conditions such as voltage and temperature.

Reference Axis
An axis perpendicular to the sensing face and passing through its center.

Repeatability
The difference between actual operating distances measured at a constant temperature and voltage over an 8-hour period. It is expressed as a percentage (%) of rated operating distance (Sn).

Repeater
Strengthens the bus signal by producing a fresh signal without distortions. It also links two portions of the same bus together. A repeater is used when the signal is weak or distorted.

Resistance (R)
A measure of the difficulty in moving electrical current through a medium when voltage is applied. It is measured in ohms.

Response frequency
The maximum rate that the output can change in response to the input and still maintain linearity.

Response Time
The time required for the device switching element to respond after the target enters or exits the sensing zone.

Retractile Cord
A cord having a specially treated jacket or insulation so that it will retract like a spring. Retractility may be added to all or part of a cord's length.

Reverse Polarity Protection
Internal components that keep the sensor from being damaged by incorrect polarity connection to the power supply.

Ring
A network topology where every node is also a repeater. Information comes into a node, information that pertains to that node is read, new information is added and the message is sent on to the next node.

Ripple
The alternating component remaining on a DC signal after rectifying, expressed in percentage of rated voltage.

RoHS
Restriction of Hazardous Substances

Router
A higher level bridge for connection of wide area networks.

RTD
Resistance Temperature Detector

Rubber
A general term used to describe wire insulation made of thermosetting elastomers, such as natural or synthetic rubbers, neoprene, Hypalon, CPE butyl rubber and others.

Glossary

Scanner Module
Allen-Bradley's designation for the gateway that plugs into their PLC and interfaces the PLCs bus to the network.

Sensing Face
The surface of the proximity sensor through which the electromagnetic (or electrostatic) field emerges.

Serial Data Communication
"ON-OFF" or "HIGH-LOW" electrical signals.

Serial Data Transfer
Information transmitted one piece at a time in a specific order.

Serve
A filament or group of filaments such as fibers or wires, wound around a central core.

Shield
In cables, a metallic layer placed around a conductor or group of conductors to prevent electrostatic or electromagnetic interference between the enclosed wires and external fields.

Shielded twisted pair
Two conductors twisted together with a metallic covering.

Short-Circuit Protection
The ability of a sensor to withstand a shorted condition (no current-limiting load connected) without damage.

Signal
Any visible or audible indication that can convey information. Also, the information conveyed through a communication system.

Simple Device
Anything that does not have LAS capabilities.

SJOOW
Junior hard service, rubber insulated, portable cord with oil resistant rubber outer jacket. Stranded copper conductors with separator and individual oil and water resistant rubber insulation. Two or more color coded conductors cabled with filler, wrapped with separator and rubber jacketed overall. 300 V.

Slew Rate
The rate of change of the output voltage with respect to a step change in input. A change in output of 0 to 10 volts at a slew rate of 1.25 V/ms would take 8 ms to slew to the new value.

Solicited Message
A response to another node or a response when it is the node's predetermined time to speak.

Solid Conductor
A conductor consisting of a single wire.

Solid State
Pertains to circuits and components using semiconductors without moving parts. Example: transistors, diodes, SCR, etc.

SOOW
Heavy duty, rubber-insulated portable cord with oil resistant rubber outer jacket. Stranded copper conductors with separator and individual oil and rubber insulation. Two or more color-coded conductors cabled with filler, wrapped with separator and rubber jacketed overall. 600 V.

Spanner
TURCK's designation for a double-sided slave node. Unit has bi-directional data from one control area segment to another in a free form format.

Star
Bus lines radiate from a single point.

Start of Message
A certain number of high bits that start a message. These consecutive bits allow the listener time to prepare to receive the data.

Static Output
A sensor output that stays energized as long as the target is present.

STOW
Heavy duty, PVC insulated, portable cord with oil resistant PVC outer jacket. Stranded copper conductors, PVC insulation. Two or more color coded conductors cabled with filler, wrapped with separator and PVC jacketed overall. Approved for outdoor use. 600 V.

Stranded Conductor
A conductor composed of groups of wires twisted together.

Switching Frequency
The maximum number of times per second that the sensor can change state (ON and OFF) under ideal conditions, usually expressed in Hertz (Hz).

System Tee
A field wireable tee.

Tee
Creates a branch or drop from a bus.

Temperature Rating
The maximum temperature at which a material may be used in continuous operation without loss of its basic properties.

Terminating Resistor
A resistor that is put at the beginning and end of the main bus line to stabilize and minimize reflections.

Thermoplastic
A material that will soften, flow or distort appreciably when subjected to heat and pressure.

Thermoset
A material that hardens or sets when heat is applied, and which, once set, cannot be re-softened by heating. The application of heat is called "curing".

Time-Delay Before Availability
The length of time after power is applied to the sensor before it is ready to operate correctly, expressed in milliseconds (ms).

Topology
A bus term that describes how the data lines connect the nodes together.

TPE
Thermo Plastic Elastomer. Broad class of polymers noted for flexibility and weld slag resistance.

TPR
Thermo Plastic Rubber. Another name for TPE.

Trunk line
The main bus line.

Twisted Pairs
A cable composed of two small, insulated conductors twisted together without a common covering.

Unlimited Peer-to-Peer
Output node gets information from several input nodes.

Unsolicited Message
A response to a change-of-state at the node.

***Uprox* Sensor ®**
An inductive proximity sensor that detects all metals at the same range. Uprox sensors are inherently weld-field immune, operate over a wider temperature range and have a higher switching frequency than standard inductive sensors.

***V*fast* ®**
DIN 43650, type A, B, I and C

VDE
German approval agency.

***versafast* ™**
M16 threads, 5, 6, 7, 8, 12, 14 and 19 pin

***Versafast* ™**
M16 threads, 5, 6, 7, 8, 12, 14 and 19 pin

Volt (V)
A unit of electrical pressure. One volt is the electrical pressure that will cause one ampere of current to flow through one ohm of resistance.

Voltage Rating
The highest voltage that may be continuously applied to a wire in conformance with standards or specifications.

Voltage
The term most often used in place of electromotive force, potential difference, or voltage drop. Designates the electric pressure existing between two points that is capable of producing a current when a closed circuit is connected between these points.

VW-1
A flammability rating established by Underwriters Laboratories for wires and cables that pass a specially designed vertical flame test, formerly designated FR-1.

Weld-Field Immunity (WFI)
The ability of a sensor not to false-trigger in the presence
of strong magnetic fields typically produced by resistance welders.

Wicking
The longitudinal flow of a liquid in a wire or cable due to capillary action.

Wire-Break Protection
Results in the output being OFF on a DC sensor if either supply wire is broken.

Word
2 bytes.

REGISTRATION INSTRUCTIONS

(TO BE COMPLETED BY THE END USER OF THE SENSORS)
THIS INFORMATION WILL BE KEPT IN STRICT CONFIDENCE

STEP 1: Please make a Photocopy of this form.
STEP 2: Fill in all information below.
STEP 3: Line 13 (to put this warranty into effect, it must be validated by the signature of the End-User and an authorized **TURCK** Distributor or Representative.
STEP 4: Return this Registration to **TURCK** (keep a copy for your records).

Date: _____

LIFETIME WARRANTY REGISTRATION
(INDUCTIVE, INDUCTIVE MAGNET & CAPACITIVE SENSORS ONLY)

Please Print
End User

1. Company Name: _____
2. Division: _____ Dept: _____
3. Address: _____
4. City: _____ State: _____ Zip: _____
5. Phone: ( ) _____ Your Name: _____

Warranty Terms and Conditions

RISK OF LOSS

Delivery of the equipment to a common carrier shall constitute delivery to the Purchaser and the risk of loss shall transfer at that time to Purchaser. Should delivery be delayed due to an act or omission on the part of the Purchaser, risk of loss shall transfer to the Purchaser upon notification by **TURCK Inc.** that the order is complete and ready for shipment.

WARRANTIES

TURCK INC. (hereinafter **"TURCK"**) offers five (5) WARRANTIES to cover all products sold. They are as follows:

1) The **12-MONTH WARRANTY** is available for the products listed - generally those not covered by **LIFETIME**, **5-YEAR**, **24-MONTH** or **18-MONTH** warranty. No registration required.
2) The **18-MONTH WARRANTY** is available for the products listed - generally those not covered by **LIFETIME** or **5-YEAR WARRANTY**. No registration is required.
3) The **24-MONTH WARRANTY** is available for the products listed - generally those not covered by **LIFETIME**, **5-YEAR** or **18-MONTH**. No registration is required.
4) The **5-YEAR WARRANTY** is available generally for the products listed. No registration is required.
5) A **LIFETIME WARRANTY** is available for the products listed. It becomes effective when the accompanying **TURCK LIFETIME WARRANTY REGISTRATION** is completed and returned to **TURCK**.

GENERAL TERMS AND CONDITIONS FOR ALL WARRANTIES

- **12-MONTH STANDARD WARRANTY**
- **18-MONTH STANDARD WARRANTY**
- **24-MONTH STANDARD WARRANTY**
- **5-YEAR WARRANTY**
- **LIFETIME WARRANTY**

TURCK warrants the Products covered by the respective WARRANTY AGREEMENTS to be free from defects in material and workmanship under normal and proper usage for the respective time periods listed above from the date of shipment from **TURCK**. In addition, certain specific terms apply to the various WARRANTIES.

THESE EXPRESS WARRANTIES ARE IN LIEU OF AND EXCLUDE ALL OTHER REPRESENTATIONS MADE - BOTH EXPRESSED AND IMPLIED. THERE ARE NO WARRANTIES OF MERCHANTABILITY OR OF FITNESS FOR A PARTICULAR PURPOSE FOR PRODUCTS COVERED BY THESE TERMS AND CONDITIONS.

TURCK warrants that the goods sold are as described, but no promise, description, affirmation of fact, sample model or representation, oral or written shall be part of an order, unless set forth in these terms and conditions, or are in writing and signed by an authorized representative of **TURCK**. These WARRANTIES do not apply to any Product which has been subject to misuse, negligence, or accident - or to any Product which has been modified or repaired, improperly installed, altered, or disassembled -except according to **TURCK's** written instructions.

These WARRANTIES are subject to the following conditions:

1) These WARRANTIES are limited to the electronic and mechanical performance only, as expressly detailed in the Product specifications and NOT to cosmetic performance.
2) These WARRANTIES shall not apply to any cables attached to, or integrated with the Product. However, the **18-MONTH WARRANTY** shall apply to cables sold separately by **TURCK**.
3) These WARRANTIES shall not apply to any Products which are stored, or utilized, in harsh environmental or electrical conditions outside **TURCK's** written specifications.
4) The WARRANTIES are applicable only to Products shipped from **TURCK** subsequent to January 1, 1988.

ADDITIONAL SPECIFIC TERMS FOR -

(12-MONTH STANDARD WARRANTY) for Linear Displacement Transducers and RFID products.

(18-MONTH STANDARD WARRANTY) FOR ULTRASONIC SENSORS, CABLES AND ALL NON-SENSING PRODUCTS SOLD BY TURCK INC. INCLUDING MULTI-SAFE, MULTI-MODUL, MULTI-CART AND RELATED AMPLIFIER PRODUCTS, RELAYS AND TIMERS.

(24-MONTH STANDARD WARRANTY) FOR ENCODERS.

5-YEAR WARRANTY FOR INDUCTIVE AND CAPACITIVE PROXIMITY SENSORS: The periods covered for the above WARRANTIES and Products shall be 12 MONTHS, 18-MONTHS, 24-MONTHS and 5-YEARS, respectively, from the date of shipment from TURCK.

Warranty Terms and Conditions

ADDITIONAL SPECIFIC TERMS FOR - (continued)

LIFETIME WARRANTY (OPTIONAL - REGISTRATION REQUIRED) FOR INDUCTIVE, INDUCTIVE MAGNET OPERATED AND CAPACITIVE PROXIMITY SENSORS SOLD TO THE ORIGINAL PURCHASER FOR THE LIFETIME OF THE ORIGINAL APPLICATION.

The following terms apply to the LIFETIME WARRANTY in addition to the General Terms:

1) This WARRANTY shall be effective only when the LIFETIME WARRANTY REGISTRATION has been completed, signed by the End User and an authorized **TURCK** Representative or Distributor and has been received by **TURCK** no later than six (6) months after installation in the End User's Plant, or two (2) years from the date product was shipped from **TURCK**, whichever is sooner.
2) This warranty is available only to **TURCK's** authorized Representatives, Distributors and to the Original User. (The term "Original User" means that person, firm, or corporation which first uses the Product on a continuous basis in connection with the operation of a production line, piece of machinery, equipment, or similar device.) In the event the ownership of the product is transferred to a person, firm or corporation other than the Original User, this WARRANTY shall terminate.
3) This WARRANTY is applicable only to the Original Application. In the event the machinery, equipment, or production line to which the Product is connected, or on which it is installed, is substituted, changed, moved or replaced, the WARRANTY shall terminate.
4) This WARRANTY shall be valid only if the Product was purchased by the Original User from **TURCK**, or from an authorized **TURCK** Distributor, or was an integral part of a piece of machinery and equipment obtained by the Original user from an Original Equipment Manufacturer, which itself, was purchased directly from **TURCK** or from an authorized Distributor.

PURCHASER'S REMEDIES

This Remedy shall apply to all WARRANTIES. If a **TURCK** Distributor desires to make a WARRANTY Claim, the Distributor shall, if requested by **TURCK**, ship the Product to **TURCK's** factory in Minneapolis, Minnesota, postage or freight prepaid. If the User desires to make a WARRANTY Claim, they shall notify the authorized **TURCK** Distributor from whom it was purchased or, if such Distributor is unknown, shall notify **TURCK**. **TURCK** shall, at its option, take any of the following two courses of action for any products which **TURCK** determines are defective in materials or workmanship.

1) Repair or replace the Product and ship the Product to the Original Purchaser or to the authorized **TURCK** Distributor, postage or freight prepaid; or
2) Repay to the Original Purchaser that price paid by the Original Purchaser; provided that if the claim is made under the LIFETIME WARRANTY, and such Product is not then being manufactured by **TURCK**, then the amount to be repaid by **TURCK** to the Original Purchaser shall be reduced according to the following schedule:

Number of Years Since Date of Purchase by Original Purchaser	Percent of Original Purchase Price To Be Paid by TURCK
10	50%
15	25%
20	10%
More than 20	5%

PURCHASER'S REMEDIES SHALL BE LIMITED EXCLUSIVELY TO THE RIGHT OF REPLACEMENT, REPAIR OR REPAYMENT AS PROVIDED AND DOES NOT INCLUDE ANY LABOR COST OR REPLACEMENT AT ORIGINAL PURCHASER'S SITE. TURCK SHALL NOT BE LIABLE FOR ANY CONSEQUENTIAL DAMAGES RESULTING FROM ANY BREACH OF ANY WARRANTY, EXPRESSED OR IMPLIED, APPLICABLE TO THE PRODUCT, INCLUDING WITHOUT LIMITATION, ANY DAMAGES RESULTING FROM PROPERTY DAMAGE, PERSONAL INJURY OR BUSINESS INTERRUPTION.

CONSIDER SAFETY AND PROTECTION PRECAUTIONS

TURCK takes great care to design and build reliable and dependable products, however, some products can fail eventually. You must take precautions to design your equipment to prevent property damage and personal injury in the unlikely event of failure. As a matter of policy, **TURCK** does NOT recommend the installation of electronic controls as the sole device FOR THE PROTECTION OF PERSONNEL in connection with power driven presses, brakes, shears and similar equipment and, therefore, the customer should build in redundancy or dual control using approved safety devices for these applications.

GOVERNING LAW

The sale and purchase of Products covered hereby and all terms and conditions hereof shall be governed by the law of the State of Minnesota.

TURCK

PROCESS AUTOMATION

THE ASSET MANAGEMENT PRODUCT COMPANY

TURCK products enable active management of the physical layer in a modern Asset Management System. In other words, the administration of the infrastructure for the connection of fieldbus devices and control systems is made possible. **TURCK** was involved from the very start in the FDT/DTM concept. And today all significant physical layer components feature DTM's. This includes the classic point-to-point wiring (interface technology), the point-to-bus wiring (remote I/O) as well as bus-to-bus communication (fieldbus technology).

FDT

FOUNDATION

The DPC system (Diagnostic Power Conditioner) supports the commissioning of a fieldbus system and detects creeping changes within individual fieldbus segments over a long period of time. Provided with a suitable alarm function, interferences and even down times can be prevented. The DPC system monitor FF-H1 segments, but it also implements self-diagnostics and diagnostics of the FF-High-Speed-Ethernet. This data can be displayed via standard FF function blocks or graphically via a DTM.
